

Package ‘warbleR’

January 29, 2018

Type Package

Title Streamline Bioacoustic Analysis

Version 1.1.10

Date 2018-01-28

Author Marcelo Araya-Salas & Grace Smith Vidaurre

Maintainer Marcelo Araya-Salas <araya-salas@cornell.edu>

Description A tool to streamline the analysis of animal acoustic signal structure. The package offers functions for downloading avian vocalizations from the open-access online repository 'Xeno-Canto' <<http://xeno-canto.org/>>, displaying the geographic extent of the recordings, manipulating sound files, detecting acoustic signals, assessing performance of methods that measure acoustic similarity, conducting cross-correlations, dynamic time warping, measuring acoustic parameters and analysing interactive vocal signals, among others. Most functions working iteratively allow parallelization to improve computational efficiency.

License GPL (>= 2)

Imports bitops, doParallel, dtw, fftw, foreach, graphics, grDevices, iterators, jpeg, monitoR, parallel, pbapply, pbmcapply, proxy, RCurl, rjson, stats, signal, utils, methods

Depends R (>= 3.2.1), maps, tuneR, seewave (>= 2.0.1)

LazyData TRUE

URL <https://github.com/maRce10/warbleR>

BugReports <https://github.com/maRce10/warbleR/issues>

NeedsCompilation no

Suggests knitr, ggplot2

VignetteBuilder knitr

RoxygenNote 6.0.1

autodetec	<i>Automatically detect vocalizations in sound files</i>
-----------	--

Description

autodetec automatically detects the start and end of vocalizations in sound files based on amplitude, duration, and frequency range attributes.

Usage

```
autodetec(X = NULL, threshold = 15, envt = "abs", ssmooth = NULL, msmooth = NULL,
  power = 1, bp = NULL, osci = FALSE, wl = 512, xl = 1, picsize = 1, res = 100,
  flim = c(0,22), ls = FALSE, sxrow = 10, rows = 10, mindur = NULL, maxdur =
  NULL, redo = FALSE, img = TRUE, it = "jpeg", set = FALSE, flist = NULL, smadj = NULL,
  parallel = 1, path = NULL, pb = TRUE, pal = reverse.gray.colors.2,
  fast.spec = FALSE, ...)
```

Arguments

X	'selection.table' object or data frame with results from manualoc function or any data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end).
threshold	A numeric vector of length 1 specifying the amplitude threshold for detecting signals (in %).
envt	Character vector of length 1 specifying the type of envelope to be used: "abs" for absolute amplitude envelope or "hil" for Hilbert amplitude envelope. Default is "abs".
ssmooth	A numeric vector of length 1 to smooth the amplitude envelope with a sum smooth function. Default is NULL.
msmooth	A numeric vector of length 2 to smooth the amplitude envelope with a mean sliding window. The first component is the window length and the second is the overlap between successive windows (in %). Faster than ssmooth but time detection is much less accurate. Will be deprecated in future versions. Default is NULL.
power	A numeric vector of length 1 indicating a power factor applied to the amplitude envelope. Increasing power will reduce low amplitude modulations and increase high amplitde modulations, in order to reduce background noise. Default is 1 (no change).
bp	Numeric vector of length 2 giving the lower and upper limits of a frequency bandpass filter (in kHz). Default is c(0, 22).

osci	Logical argument to add an oscillogram underneath spectrogram, as in spectro . Default is FALSE. Not applied if ls is TRUE.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
xl	Numeric vector of length 1, a constant by which to scale spectrogram width. Default is 1.
picsize	Numeric argument of length 1. Controls the relative size of the spectrogram. Default is 1.
res	Numeric argument of length 1 controlling resolution of images. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
flim	A numeric vector of length 2 for the frequency limit in kHz of the spectrogram, as in spectro . Default is c(0, 22).
ls	Logical argument. If TRUE, long spectrograms as in lspec are produced.
sxrow	A numeric vector of length 1. Specifies seconds of spectrogram per row when creating long spectrograms. Default is 10. Applied when ls = TRUE and/or when X is not provided.
rows	A numeric vector of length 1. Specifies number of rows per image file when creating long spectrograms. Default is 10. Applied when ls = TRUE and/or when X is not provided.
mindur	Numeric vector of length 1 giving the shortest duration (in seconds) of the signals to be detected. It removes signals below that threshold.
maxdur	Numeric vector of length 1 giving the longest duration (in seconds) of the signals to be detected. It removes signals above that threshold.
redo	Logical argument. If TRUE all selections will be analyzed again when code is rerun. If FALSE only the selections that do not have an 'autodetec' generated image file in the working directory will be analyzed. Default is FALSE.
img	Logical argument. If FALSE, image files are not produced. Default is TRUE.
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
set	A logical argument indicating wheter the settings of the autodetection process should be included in the image file name. If TRUE, threshold (th), envelope (envt), bandpass (bp), power (pw), smooth (smo, either mmsooth[1] or ssmooth), maxdur (mxdu), and mindur (midu) are included.
flist	character vector or factor indicating the subset of files that will be analyzed. Ignored if X is provided.
smadj	adjustment for amplitude smoothing. Character vector of length one indicating whether start end values should be adjusted. "start", "end" or "both" are the inputs admitted by this argument. Amplitude smoothing through ssmooth generates a predictable deviation from the actual start and end positions of the signals, determined by the threshold and ssmooth values. This deviation is more obvious (and problematic) when the increase and decrease in amplitude at the start and end of the signal (respectively) is not gradual. Ignored if ssmooth is NULL.

<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>pal</code>	Color palette function for spectrogram. Default is <code>reverse.gray.colors.2</code> . See spectro for more palettes. Palettes as gray.2 may work better when <code>fast.spec = TRUE</code> .
<code>fast.spec</code>	Logical. If TRUE then <code>image</code> function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast.spec' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
<code>...</code>	Additional arguments to be passed to a modified version of spectro for customizing graphical output.

Details

This function determines the start and end of signals in the segments of the sound files listed in the input data frame. Alternatively, if no data frame is provided, the function detects signals across each entire sound file and creates long spectrograms highlighting the start and of the detected signals for all sound files in the working directory. The input data frame should have the following columns: `c("sound.files", "selec", "start", "end")`. The output of [manualoc](#) can be used as the input data frame. This function uses a modified version of the [timer](#) function from `seewave` package to detect signals.

Value

Image files with spectrograms showing the start and end of the detected signals. It also returns a data frame containing the start and end of each signal by sound file and selection number.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>). Implements a modified version of the `timer` function from `seewave`.

Examples

```
## Not run:
# Set temporary working directory
setwd(tempdir())

data(list = c("Phae.long1", "Phae.long2", "Phae.long3", "Phae.long4"))
writeWave(Phae.long1, "Phae.long1.wav")
writeWave(Phae.long2, "Phae.long2.wav")
writeWave(Phae.long3, "Phae.long3.wav")
writeWave(Phae.long4, "Phae.long4.wav")
```

```

ad <- autotetec(threshold = 5, env = "hil", ssmooth = 300, power=1,
bp=c(2,9), xl = 2, picsize = 2, res = 200, flim= c(1,11), osci = TRUE,
wl = 300, ls = FALSE, sxrow = 2, rows = 4, mindur = 0.1, maxdur = 1, set = TRUE)

#run it with different settings
ad <- autotetec(threshold = 90, env = "abs", ssmooth = 300, power = 1, redo = TRUE,
bp=c(2,9), xl = 2, picsize = 2, res = 200, flim= c(1,11), osci = TRUE,
wl = 300, ls = FALSE, sxrow = 2, rows = 4, mindur=0.1, maxdur=1, set = TRUE)

#check this folder!!
getwd()

## End(Not run)

```

catalog

Create catalog of vocal signals

Description

catalog produces spectrograms of selections (signals) split into multiple rows and columns.

Usage

```

catalog(X, flim = c(0, 22), nrow = 4, ncol = 3, same.time.scale = TRUE,
collev = seq(-40, 0, 1), ovlp = 50, parallel = 1, mar = 0.05, prop.mar = NULL,
lab.mar = 1, wl = 512, gr = FALSE, pal = reverse.gray.colors.2, it = "jpeg", path = NULL,
pb = TRUE, fast.spec = FALSE, res = 100, orientation = "v",
labels = c("sound.files", "selec"), height = NULL, width = NULL, tags = NULL,
tag.pal = list(temp.colors, heat.colors, topo.colors), legend = 3,
cex = 1, leg.wd = 1, img.suffix = NULL, img.prefix = NULL, tag.widths = c(1, 1),
hatching = 0, breaks = c(5, 5), group.tag = NULL, spec.mar = 0, spec.bg = "white",
max.group.cols = NULL, sub.legend = FALSE, rm.axes = FALSE, title = NULL,
by.row = TRUE, box = TRUE)

```

Arguments

X	'selection.table' object or data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). Default is NULL.
flim	A numeric vector of length 2 indicating the highest and lowest frequency limits (kHz) of the spectrogram, as in spectro . Default is c(0,22).
nrow	A numeric vector of length 1. Specifies number of rows. Default is 4.
ncol	A numeric vector of length 1. Specifies number of columns. Default is 3.
same.time.scale	Logical. Controls if all spectrograms are in the same time scale (i.e. have the same duration).

collev	A numeric vector of length 3. Specifies levels to partition the amplitude range of the spectrogram (in dB). The more levels the higher the resolution of the spectrogram. Default is <code>seq(-40, 0, 1)</code> . <code>seq(-115, 0, 1)</code> will produces spectrograms similar to other acoustic analysis software packages.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 50. High values of <code>ovlp</code> slow down the function but produce more accurate selection limits (when <code>X</code> is provided).
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
mar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of selections, dealineating spectrogram limits. Default is 0.05.
prop.mar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of selections as a proportion of the duration of the signal. If provided 'mar' argument is ignored. Default is NULL. Useful when having high variation in signal duration. Ignored if <code>same.time.scale = FALSE</code> .
lab.mar	Numeric vector of length 1. Specifies the space allocated to labels and tags (the upper margin). Default is 1.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
gr	Logical argument to add grid to spectrogram. Default is FALSE.
pal	Color palette function for spectrogram. Default is <code>reverse.gray.colors.2</code> . See spectro for more palettes. Palettes as gray.2 may work better when <code>fast.spec = TRUE</code> .
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
fast.spec	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast.spec' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
res	Numeric argument of length 1. Controls image resolution. Default is 100 (faster) although 300 is recommended for publication/presentation quality. Note that high resolution produce significantly bigger image files. This could be problematic when creating pdf files using catalog .
orientation	String. Indicates whether a letter page size image is produced in vertical ('v' option) or horizontal orientation ('h' option). Note that width and height can also be specified.
labels	String vector. Provides the column names that will be used as labels above the corresponding spectrograms.

height	Numeric. Single value (in inches) indicating the height of the output image files. Default is 11 for vertical orientation.
width	Numeric. Single value (in inches) indicating the width of the output image files. Default is 8.5 for vertical orientation.
tags	String vector. Provides the column names that will be used for the color tagging legend above. Tags can also be numeric. Continuous variables would be break down in 10 color classes. spectrograms.
tag.pal	List of color palette function for tags. Should be of length 1, 2. Default is <code>list(temp.colors, heat.colors, topo.colors)</code> .
legend	A numeric vector of length 1 controlling a legend for color tags is added. Ignored if no tags are provided. Four values are allowed: <ul style="list-style-type: none"> • 0: No label • 1: Label for the first color tag • 2: Label for the second color tag • 3: Labels both color tags Default is 3. Currently no legend can be set for group tags. Use labels instead.
cex	A numeric vector of length 1 giving the amount by which text (including labels and axis) should be magnified. Default is 1.
leg.wd	Numeric. Controls the width of the legend column. Default is 1.
img.suffix	A character vector of length 1 with a suffix (label) to add at the end of the names of image files. Default is NULL (no suffix). Useful to label catalogs from different individuals, species or sites.
img.prefix	A character vector of length 1 with a prefix (label) to add at the beginning of the names of image files. Default is NULL (no prefix). Useful to label catalogs from different individuals, species or sites and ensure they will be grouped together when sorted by file name.
tag.widths	A numeric vector of length 2 to control the relative width of the color tags (when 2 tags are provided).
hatching	A numeric vector of length 1 controlling cross-hatching is used for color tags. Several cross-hatching patterns are used to make tags with similar colors more distinguishable. Four values are allowed: <ul style="list-style-type: none"> • 0: No cross-hatching • 1: Cross-hatching the first color tag • 2: Cross-hatching the second color tag • 3: Cross-hatching both color tags
breaks	Numeric vector of length 1 or 2 controlling the number of intervals in which a numeric tag will be divided. The numbers control the first and second tags respectively. Ignored if tags are not numeric. Default is <code>c(5, 5)</code> .
group.tag	Character vector of length 1 indicating the column name to be used to color the empty plot areas around the spectrograms. If provided selections that belong to the same tag level are clumped together in the catalog (the 'X' data frame is sorted by that column). This tags cannot be included in the legend so it would be better to use the label field to identify the different levels.

<code>spec.mar</code>	Numeric vector of length 1 to add space at the top, left and right sides of the spectrogram. Useful to better display the grouping of selections when 'group.tag' is provided. Internally applied for setting 'mar' using par .
<code>spec.bg</code>	Character vector of length 1 to control the background color of the spectrogram. Default is 'white'. Ignored if <code>group.tag = NULL</code> .
<code>max.group.cols</code>	Numeric vector of length 1 indicating the number of different colors that will be used for group tags (see 'group.tag' argument). If provided (and the number is smaller than the number of levels in the 'group.tag' column) the colors will be recycled, although ensuring that adjacent groups do not share the same color. Useful when the 'group.tag' has many levels and the colors assigned become very similar. Default is <code>NULL</code> .
<code>sub.legend</code>	Logical. If <code>TRUE</code> then only the levels present on each page are shown in the legend. Default is <code>FALSE</code> .
<code>rm.axes</code>	Logical. If <code>TRUE</code> frequency and time axes are excluded. Default is <code>FALSE</code> .
<code>title</code>	Character vector of length 1 to set the title of catalogs.
<code>by.row</code>	Logical. If <code>TRUE</code> (default) catalogs are filled by rows.
<code>box</code>	Logical. If <code>TRUE</code> (default) a box is drawn around spectrograms and corresponding labels and tags. are

Details

This functions aims to simplify the visual exploration of multiple vocalizations. The function plots a matrix of spectrograms from a selection table. Spectrograms can be labeled or color tagged to facilitate exploring variation related to a parameter of interest (e.g. location, song type). A legend will be added to help match colors with tag levels (if legend is > 0). Different color palettes can be used for each tag. Numeric tags are split in intervals (the number of intervals can be controlled with `break` argument). The width and height can also be adjusted to fit more column and/or rows. This files can be put together in a single pdf file with [catalog2pdf](#). We recommend using low resolution (~60-100) and smaller dimensions (width & height < 10) if aiming to generate pdfs (otherwise pdfs could be pretty big).

Value

Image files with spectrograms of whole sound files in the working directory. Multiple pages can be returned, depending on the length of each sound file.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>)

## End(Not run)

```

catalog2pdf

catalog2pdf combines [catalog](#) images into pdfs

Description

catalog2pdf combines [catalog](#) images into pdfs

Usage

```

catalog2pdf(keep.img = TRUE, overwrite = FALSE, parallel = 1, path = NULL,
pb = TRUE, by.img.suffix = FALSE, ...)

```

Arguments

keep.img	Logical argument. Indicates whether jpeg files should be kept (default) or remove. (including sound file and page number) should be magnified. Default is 1.
overwrite	Logical argument. If TRUE all jpeg pdf will be produced again when code is rerun. If FALSE only the ones missing will be produced. Default is FALSE.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
by.img.suffix	Logical. If TRUE catalogs with the same image suffix will be put together in a single pdf (so one pdf per image suffix in the catalog images). Default is FALSE (i.e. no suffix).
...	Additional arguments to be passed to the internal pdf creating function pdf for customizing output.

Details

The function combines catalog images in .jpeg format from the [catalog](#) function into pdfs. Note that using lower resolution and smaller dimension (width and height) when creating catalogs will substantially decrease the size of pdf files (which could be pretty big).

## End(Not run)
```

checksels

Check selection data frames

Description

checksels checks whether selections can be read by subsequent functions.

Usage

```
checksels(X, parallel = 1, path = NULL, check.header = FALSE)
```

Arguments

X	'selec.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. Alternatively, a 'selec.table' class object can be input to double check selections. The output of manualoc or autodetec can be used as the input data frame.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.

path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
check.header	Logical. Controls whether sound file headers correspond to the actual file properties (i.e. if is corrupted). This could significantly affect the performance of the function (much slower) particularly with long sound files.

Details

This function checks 1) if the selections listed in the data frame correspond to .wav files in the working directory, 2) if the sound files can be read and if so, 3) if the start and end time of the selections are found within the duration of the sound files. Note that the sound files should be in the working directory (or the directory provided in 'path'). This is useful for avoiding errors in downstream functions (e.g. [specan](#), [xcorr](#), [catalog](#), [dfDTW](#)). Note that corrupt files can be fixed using [fixwavs](#) ('sox' must be installed to be able to run this function).

Value

A data frame including the columns in the input data frame (X) and 2 additional columns: "check.res" (check selections), and "min.n.samples" (the smallest number of samples). Note the number of samples available in a selection limits the minimum window length (wl argument in other functions) that can be used in batch analyses.

}
```

checkwavs

*Check .wav files***Description**

checkwavs checks whether .wav files can be read by subsequent functions.

Usage

```
checkwavs(X = NULL, path = NULL)
```

Arguments

X	Optional. 'selection.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. The output of manualoc or autodetec can be used as the input data frame. If provided the function also returns the smallest number of samples from the listed selections, which limits the minimum window length (wl argument in other functions) that can be used in batch analyses. This could be useful for avoiding errors in downstream functions (e.g. specan).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.

Details

This function checks if .wav files in the working directory can be read. Users must set the working directory where they wish to check .wav files beforehand. If X is provided it also returns the smallest number of samples from the selections listed in X (if all files can be read). Note that corrupt files can be fixed using [fixwavs](#) ('sox' must be installed to be able to run this function). The function is intended for a "quick and dirty" check of the .wav files in a selections data frame. For a more thorough analysis see [checksels](#).

Value

If all .wav files are ok, returns message "All files can be read!". Otherwise returns the names of the corrupted .wav files.

}
```

color.spectro

Highlight spectrogram regions

Description

color.spectro highlights spectrogram regions specified by users

Usage

```
color.spectro(wave, wl = 512, wn = "hanning", ovlp = 70,
dB = "max0", collevels = NULL, selec.col = "red2", col.clm = NULL,
base.col = "black", bg.col = "white", cexlab = 1, cexaxis = 1, tlab = "Time (s)",
flab = "Frequency (kHz)", title = NULL, axisX = TRUE, axisY = TRUE,
flim = NULL, rm.zero = FALSE, X = NULL, fast.spec = FALSE, t.mar = NULL, f.mar = NULL,
interactive = NULL, add = FALSE)
```

Arguments

wave	A 'wave' object produced by readWave or similar functions.
wl	A numeric vector of length 1 specifying the window length of the spectrogram. Default is 512.
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
ovlp	Numeric vector of length 1 specifying the percent overlap between two consecutive windows, as in spectro . Default is 70.
dB	Character vector of length 1 controlling the amplitude weights as in spectro . Default is 'max0'.

collevels	Numeric. Levels used to partition amplitude range as in spectro . Default is NULL.
selec.col	Character vector of length 1 specifying the color to be used to highlight selection. See 'col.clm' for specifying unique colors for each selection. Default is 'red2'. Ignored if 'col.cm' and 'X' are provided.
col.clm	Character vector of length 1 indicating the name of the column in 'X' that contains the color names for each selection. Ignored if X == NULL or interactive != NULL. Default is NULL.
base.col	Character vector of length 1 specifying the color of the background spectrogram. Default is 'black'.
bg.col	Character vector of length 1 specifying the background color for both base and highlighted spectrograms. Default is 'white'.
cexlab	Numeric vector of length 1 specifying the relative size of axis labels. See spectro . Default is 1.
cexaxis	Numeric vector of length 1 specifying the relative size of axis. See spectro . Default is 1.
tlab	Character vector of length 1 specifying the label of the time axis.
flab	Character vector of length 1 specifying the label of the frequency axis.
title	Logical argument to add a title to individual spectrograms. Default is TRUE.
axisX	Logical to control whether time axis is plotted. Default is TRUE.
axisY	Logical to control whether frequency axis is plotted. Default is TRUE.
flim	A numeric vector of length 2 for the frequency limit (in kHz) of the spectrogram, as in spectro . Default is NULL.
rm.zero	Logical indicated if the 0 at the start of the time axis should be removed. Default is FALSE.
X	Optional. Data frame containing columns for start and end time of signals ('start' and 'end') and low and high frequency ('bottom.freq' and 'top.freq').
fast.spec	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as collevels, and sc (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package monitoR) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
t.mar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points to be added when highlighting selection. Default is NULL.
f.mar	Numeric vector of length 1. Specifies the margins adjacent to the low and high frequencies to be added when highlighting selection. Default is NULL.
interactive	Numeric. Allow user to interactively select the signals to be highlighted by clicking on the graphic device. Users must select the opposite corners of a square delimiting the spectrogram region to be highlighted. Controls the number of signals that users would be able to select (2 clicks per signal).

add Logical. If TRUE new highlighting can be applied to the current plot (which means that the function with `add = FALSE` should be run first). Default is FALSE.

Details

This function highlights regions of the spectrogram with different colors. The regions to be highlighted can be provided in a selection table (as the example data 'selec.table') or interactively ('interactive' argument).

Value

A plot is produced in the graphic device.

dB = "B", col.clm = "colors", t.mar = 0.07, f.mar = 1, interactive = 2)

## End(Not run)
```

Description

compare.methods creates graphs to visually assess performance of acoustic distance measurements

Usage

```
compare.methods(X = NULL, flim = c(0, 22), bp = c(0, 22), mar = 0.1, wl = 512, ovlp = 90,
res = 150, n = 10, length.out = 30, methods = c("XCORR", "dfDTW", "ffDTW", "SP"),
it = "jpeg", parallel = 1, path = NULL, sp = NULL, pb = TRUE, grid = TRUE,
clip.edges = TRUE, threshold = 15, na.rm = FALSE, scale = FALSE,
pal = reverse.gray.colors.2, img = TRUE, ...)
```

Arguments

X	'selection.table' object or data frame with results from manualoc function, autodetec function, or any data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). Default NULL.
flim	A numeric vector of length 2 for the frequency limit in kHz of the spectrogram, as in spectro . Default is c(0, 22).
bp	numeric vector of length 2 giving the lower and upper limits of the frequency bandpass filter (in kHz) used in the acoustic distance methods. Default is c(0, 22). Note that for XCORR this argument sets the fringe argument from the xcorr function.
mar	Numeric vector of length 1. Specifies plot margins around selection in seconds. Default is 0.1.
wl	A numeric vector of length 1 specifying the window length of the spectrogram and cross-correlation, default is 512.
ovlp	Numeric vector of length 1 specifying the percent overlap between two consecutive windows, as in spectro . Default is 90.
res	Numeric argument of length 1. Controls image resolution. Default is 150.
n	Numeric argument of length 1. Defines the number of plots to be produce. Default is 10.
length.out	A character vector of length 1 giving the number of measurements of fundamental or dominant frequency desired (the length of the time series). Default is 30.
methods	A character vector of length 2 giving the names of the acoustic distance methods that would be compared. The methods available are: cross-correlation (XCORR, from xcorr), dynamic time warping on dominant frequency time series (dfDTW, from dtw applied on dfts output), dynamic time warping on dominant frequency time series (ffDTW, from dtw applied on ffts output), spectral parameters (SP, from specan).

it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
sp	Data frame with acoustic parameters as the one generated by specan . Must contain 'sound.files' and 'selec' columns and the same selections as in 'X'.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
grid	Logical argument to control the presence of a grid on the spectrograms (default is TRUE).
clip.edges	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed when using dfDTW and ffDTW methods. If TRUE this edges will be excluded and signal contour will be calculated on the remaining values. Default is TRUE.
threshold	amplitude threshold (%) for dominant and/or fundamental frequency detection when using dfDTW, ffDTW and SP methods. Default is 15.
na.rm	Logical. If TRUE all NAs produced when pairwise cross-correlations failed are removed from the results. This means that all selections with at least 1 cross-correlation that failed are excluded in both methods under comparison. Only apply if XCORR is one of the methods being compared.
scale	Logical. If TRUE dominant and/or fundamental frequency values are z-transformed using the scale function, which "ignores" differences in absolute frequencies between the signals in order to focus the comparison in the frequency contour, regardless of the pitch of signals. Default is TRUE.
pal	A color palette function to be used to assign colors in the spectrograms, as in spectro . Default is reverse.gray.colors.2.
img	A logical argument specifying whether an image files would be produced. Default is TRUE.
...	Additional arguments to be passed to a modified version of spectro for customizing graphical output. This includes fast.spec, an argument that speeds up the plotting of spectrograms (see description in speccreator).

Details

This function produces graphs with spectrograms from 4 signals in the provided data frame that allow visual inspection of the performance of acoustic distance methods at comparing those signals. The signals are randomly picked up from the provided data frame (X argument). The spectrograms are all plotted with the same frequency and time scales. The function compares 2 methods at a time. The methods available are: cross-correlation (XCORR, from [xcorr](#)), dynamic time warping on dominant frequency time series (dfDTW, from [dtw](#) applied on [dfts](#) output), dynamic time warping on dominant frequency time series (ffDTW, from [dtw](#) applied on [ffts](#) output), spectral parameters (SP, from [specan](#)). The graph also contains 2 scatterplots (1 for each method) of the acoustic space

of all signals in the input data frame 'X'. The compared selections are randomly picked up from the pool of selections in the input data frame. The argument 'n' defines the number of comparisons (i.e. graphs) to be produced. The acoustic pairwise distance between signals is shown next to the arrows linking them. The font color of a distance value correspond to the font color of the method that generated it, as shown in the scatterplots. Distances are standardized, being 0 the distance of a signal to itself and 1 the farthest pairwise distance in the pool of signals. Principal Component Analysis ([princomp](#)) is applied to calculate distances when using spectral parameters (SP). In that case the first 2 PC's are used. Classical Multidimensional Scalling (also known as Principal Coordinates Analysis, ([cmdscale](#))) is used for all other methods. Note that SP can only be used with at least 22 selections (number of rows in input data frame) as PCA only works with more units than variables. The graphs are return as image files in the working directory. The file name contains the methods being compared and the rownumber of the selections. This function uses internally a modified version of the [spectro](#) function from seewave package to create spectrograms.

Value

Image files with 4 spectrograms of the selection being compared and scatterplots of the acoustic space of all signals in the input data frame 'X'.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>). It uses internally a modified version of the [spectro](#) function from seewave package to create spectrograms.

Examples

```
{
# Set temporary working directory
setwd(tempdir())

data(list = c("Phae.long1", "Phae.long2", "Phae.long3", "Phae.long4", "selec.table"))
writeWave(Phae.long1,"Phae.long1.wav")
writeWave(Phae.long2,"Phae.long2.wav")
writeWave(Phae.long3,"Phae.long3.wav")
writeWave(Phae.long4,"Phae.long4.wav")

compare.methods(X = selec.table, flim = c(0, 10), bp = c(0, 10), mar = 0.1, wl = 300,
ovlp = 90, res = 200, n = 10, length.out = 30,
methods = c("XCORR", "dfDTW"), parallel = 1, it = "jpeg")

#remove progress bar
compare.methods(X = selec.table, flim = c(0, 10), bp = c(0, 10), mar = 0.1, wl = 300,
ovlp = 90, res = 200, n = 10, length.out = 30,
methods = c("XCORR", "dfDTW"), parallel = 1, it = "jpeg", pb = FALSE)

#check this folder!
```

```

getwd()

#compare SP and XCORR
#first we need to create a larger data set as the PCA that summarizes the spectral parameters
#needs more units (rows) than variables (columns)
#so I just create a new selection table repeating 3 times selec.table
st2 <- rbind(selec.table, selec.table, selec.table)

#note that the selection labels should be also changed
st2$selec <- 1:nrow(st2)
#now we can compare SP method against XCORR
compare.methods(X = st2, flim = c(0, 10), bp = c(0, 10), mar = 0.1, wl = 300,
ovlp = 90, res = 200, n = 10, length.out = 30,
methods = c("XCORR", "SP"), parallel = 1, it = "jpeg")

#compare SP method against dfDTW
compare.methods(X = st2, flim = c(0, 10), bp = c(0, 10), mar = 0.1, wl = 300,
ovlp = 90, res = 200, n = 10, length.out = 30,
methods = c("dfDTW", "SP"), parallel = 1, it = "jpeg")

#alternatively we can provide our own SP matrix
sp <- specan(selec.table, bp = c(0, 10))

#and selec just a few variables to avoid the problem of # observations vs # parameters in PCA
sp <- sp[, 1:7]

compare.methods(X = selec.table, flim = c(0, 10), sp = sp, bp = c(0, 10), mar = 0.1, wl = 300,
ovlp = 90, res = 200, n = 10, length.out = 30,
methods = c("XCORR", "SP"), parallel = 1, it = "jpeg")

#note that "SP" should also be included as a method in 'methods'
#again, all images are saved in the working directory
}

```

consolidate

Consolidate sound files into a single folder

Description

consolidate copies (sound) files scattered in several directories to a single folder.

Usage

```

consolidate(path = NULL, dest.path = NULL, pb = TRUE, file.ext = ".wav$", parallel = 1,
save.csv = TRUE, ...)

```

Arguments

<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>dest.path</code>	Character string containing the directory path where the cut sound files will be saved. If NULL (default) then the current working directory is used.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>file.ext</code>	Character string defining the file extension for the files to be consolidated. Default is <code>'\.WAV\$'</code> .
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>save.csv</code>	Logical. Controls whether a data frame containing sound file information is saved in the new folder.
<code>...</code>	Additional arguments to be passed to the internal file.copy function for customizing file copyin.

Details

This function allow users to put files scattered in several folders in a single folder.

Value

All (sound) files are consolidated (copied) to a single folder ("consolidated_files"). If `csv = TRUE` (default) a `' .csv'` file with the information about file location, old and new names (if any renaming happen) is also saved in the same folder. This data frame is also return as an object in the R environment.

coord.graph

Coordinated singing graphs

Description

coord.graph creates graphs of coordinated singing and highlights the signals that overlap in time. The signals are represented by polygons of different colors.

Usage

```
coord.graph(X, only.coor = FALSE, ovlp = TRUE, xl = 1, res = 80, it = "jpeg", img = TRUE,
tlim = NULL, pb = TRUE)
```

Arguments

X	Data frame containing columns for singing event (sing.event), individual (indiv), and start and end time of signal (start and end).
only.coor	Logical. If TRUE only the segment in which both individuals are singing is included (solo singing is removed). Default is FALSE.
ovlp	Logical. If TRUE the vocalizations that overlap in time are highlighted. Default is TRUE.
xl	Numeric vector of length 1, a constant by which to scale spectrogram width. Default is 1.
res	Numeric argument of length 1. Controls image resolution. Default is 80.
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
img	Logical argument. If FALSE, image files are not produced and the graphs are shown in the current graphic device. Default is TRUE.
tlim	Numeric vector of length 2 indicating the start and end time of the coordinated singing events to be displayed in the graphs.
pb	Logical argument to control progress bar and messages. Default is TRUE.

Details

This function provides visualization for coordination of acoustic signals. Signals are shown as polygon across a time axis. It also shows which signals overlap, the amount of overlap, and highlights the individual responsible for the overlap using a color code. The width of the polygons depicting the time of overlap.

Value

The function returns a list of graphs, one for each singing event in the input data frame. The graphs can be plotted by simply calling the list. If 'img' is TRUE then the graphs are also saved in the working directory as files.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>)

Examples

```
{

# First set temporary folder
setwd(tempdir())

# load simulate singing events (see data documentation)
data(sim.coord.sing)

# make coord.graphs in tiff format
coord.graph(X = sim.coord.sing, ovlp = TRUE, only.coord = FALSE, xl = 2, res = 80,
it = "tiff", img = TRUE)

#' # make coord.graphs in graphic device format
cgs <- coord.graph(X = sim.coord.sing, ovlp = TRUE, only.coord = FALSE, img = FALSE)

cgs
}
```

coord.test

Randomization test for singing coordination

Description

Monte Carlo randomization test to assess the statistical significance of singing coordination

Usage

```
coord.test(X, iterations = 1000, less.than.chance = TRUE, parallel = 1, pb = TRUE,
rm.imcomp = FALSE, cutoff = 2, rm.solo = FALSE)
```

Arguments

X	Data frame containing columns for singing event (sing.event), individual (indiv), and start and end time of signal (start and end).
iterations	number of iterations for shuffling and calculation of the expected number of overlaps. Default is 1000.
less.than.chance	Logical. If TRUE the test evaluates whether overlaps occur less often than expected by chance. If FALSE the opposite pattern is evaluated (whether overlaps occur more often than expected by chance). Default is TRUE.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
rm.imcomp	Logical. If TRUE removes the events that don't have 2 interacting individuals. Default is FALSE.
cutoff	Numeric. Determines the minimum number of signals per individual in a singing event. Events not meeting this criterium are removed if rm.imcomp is TRUE. If rm.imcomp is FALSE cutoff is ignored. Default is 2. Note that randomization tests are not reliable with very small sample sizes. Ideally 10 or more signals per individual should be available in each singing event.
rm.solo	Logical. Controls if signals that are not intercalated at the start or end of the sequence are removed (if TRUE). For instances the sequence of signals A-A-A-B-A-B-A-B-B-B (in which A and B represent different individuals, as in the 'indiv' column) would be subset to A-B-A-B-A-B. Default is FALSE.

Details

This function calculates the probability of finding an equal or lower number (or higher if less.than.chance is TRUE) of song overlaps in a coordinated singing event. The function shuffles the sequences of signals and silence-between-signals for both individuals to produce a null distribution of expected number of overlaps by chance. The observed number of overlaps is compared to this expected values. The p-values are calculated as the proportion of random expected values that were lower (or higher) than the observed value. The function runs one test for each singing event in the input data frame. The function is equivalent to the "KeepGaps" methods described in Masco et al. 2015.

Value

A data frame with the observed number of overlaps (obs.overlaps), mean number of overlaps expected by chance, and p value.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>)

References

Masco, C., Allesina, S., Mennill, D. J., and Pruett-Jones, S. (2015). The Song Overlap Null model Generator (SONG): a new tool for distinguishing between random and non-random song overlap. *Bioacoustics*. 1-12.

Examples

```
{
#load simulated singing data (see data documentation)
data(sim.coor.sing)

# testing if coordination happens less than expected by chance
coor.test(sim.coor.sing, iterations = 100, less.than.chance = TRUE)

# testing if coordination happens more than expected by chance
coor.test(sim.coor.sing, iterations = 100, less.than.chance = FALSE)
}
```

Cryp.soui

Acoustic recording of Crypturellus soui (Little Tinamou).

Description

Acoustic recording of *Crypturellus soui* (Little Tinamou).

Usage

```
data(Cryp.soui)
```

Format

One .wav file:

Cryp.soui *Crypturellus soui* recording

Source

<http://www.xeno-canto.org/154190>

cut_sels

*Cut selections into individual sound files***Description**

cut_sels cuts selections from a selection table into individual sound files.

Usage

```
cut_sels(X, mar = 0.05, parallel = 1, path = NULL, dest.path = NULL, pb = TRUE,
labels = c("sound.files", "selec"), overwrite = FALSE, ...)
```

Arguments

X	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signals (start and end). The output of manualoc or autodetec can be used as the input data frame.
mar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of selections, dealineating spectrogram limits. Default is 0.05.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
dest.path	Character string containing the directory path where the cut sound files will be saved. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
labels	String vector. Provides the column names that will be used as labels to create sound file names. Note that they should provide unique names (otherwise sound files will be overwritten). Default is c("sound.files", "selec").
overwrite	Logical. If TRUE sound files with the same name will be overwritten. Default is FALSE.
...	Additional arguments to be passed to the internal writeWave function for customizing sound file output (e.g. normalization).

Details

This function allow users to produce individual sound files from the selections listed in a selection table as in [selec.table](#).

Value

Sound files of the signals listed in the input data frame.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>) and Grace Smith Vidaurre

```

dfDTW

Acoustic dissimilarity using dynamic time warping on dominant frequency contours

Description

dfDTW calculates acoustic dissimilarity of dominant frequency contours using dynamic time warping. Internally it applies the [dtwDist](#) function from the dtw package.

Usage

```
dfDTW(X = NULL, w1 = 512, w1.freq = 512, length.out = 20, wn = "hanning", ovlp = 70,
bp = c(0, 22), threshold = 15, threshold.time = NULL, threshold.freq = NULL, img = TRUE,
parallel = 1, path = NULL, ts.df = NULL, img.suffix = "dfDTW", pb = TRUE,
clip.edges = TRUE, window.type = "none", open.end = FALSE, scale = FALSE,
frange.detec = FALSE, fsmooth = 0.1, ...)
```

Arguments

<code>X</code>	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The output of manualoc or autodetec can be used as the input data frame.
<code>wl</code>	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
<code>wl.freq</code>	A numeric vector of length 1 specifying the window length of the spectrogram for measurements on the frequency spectrum. Default is 512. Higher values would provide more accurate measurements.
<code>length.out</code>	A numeric vector of length 1 giving the number of measurements of dominant frequency desired (the length of the time series).
<code>wn</code>	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
<code>ovlp</code>	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
<code>bp</code>	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz). Default is c(0, 22).
<code>threshold</code>	amplitude threshold (%) for dominant frequency detection. Default is 15.
<code>threshold.time</code>	amplitude threshold (%) for the time domain. Use for fundamental and dominant frequency detection. If NULL (default) then the 'threshold' value is used.
<code>threshold.freq</code>	amplitude threshold (%) for the frequency domain. Use for frequency range detection from the spectrum (see 'frange.detec'). If NULL (default) then the 'threshold' value is used.
<code>img</code>	Logical argument. If FALSE, image files are not produced. Default is TRUE.
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>ts.df</code>	Optional. Data frame with time series of signals to be compared. If provided "X" is ignored.
<code>img.suffix</code>	A character vector of length 1 with a suffix (label) to add at the end of the names of image files. Default is NULL.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
<code>clip.edges</code>	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed. If TRUE (default) this edges will be excluded and signal contour will be calculated on the remaining values. Note that DTW cannot be applied if missing values (e.i. when amplitude is not detected).
<code>window.type</code>	dtw windowing control parameter. Character: "none", "itakura", or a function (see dtw).

<code>open.end</code>	dtw control parameter. Performs open-ended alignments (see dtw).
<code>scale</code>	Logical. If TRUE dominant frequency values are z-transformed using the scale function, which "ignores" differences in absolute frequencies between the signals in order to focus the comparison in the frequency contour, regardless of the pitch of signals. Default is TRUE.
<code>frange.detec</code>	Logical. Controls whether frequency range of signal is automatically detected using the frange.detec function. If so, the range is used as the bandpass filter (overwriting 'bp' argument). Default is FALSE.
<code>fsmooth</code>	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window (in kHz) used for frequency range detection (when <code>frange.detec</code> = TRUE). This help to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.
<code>...</code>	Additional arguments to be passed to trackfreqs for customizing graphical output.

Details

This function extracts the dominant frequency values as a time series and then calculates the pairwise acoustic dissimilarity using dynamic time warping. The function uses the [approx](#) function to interpolate values between dominant frequency measures. If 'img' is TRUE the function also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the dominant frequencies.

Value

A matrix with the pairwise dissimilarity values. If img is FALSE it also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the dominant frequencies.

}

```

dfts

Extract the dominant frequency values as a time series

Description

dfts extracts the dominant frequency values as a time series. of signals selected by [manualoc](#) or [autodetec](#).

Usage

```

dfts(X, wl = 512, wl.freq = 512, length.out = 20, wn = "hanning", ovlp = 70,
bp = c(0, 22), threshold = 15, threshold.time = NULL, threshold.freq = NULL,
img = TRUE, parallel = 1, path = NULL, img.suffix = "dfts", pb = TRUE,
clip.edges = FALSE, leglab = "dfts", frange.detec = FALSE, fsmooth = 0.1, ...)

```

Arguments

X	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The ouptut of manualoc or autodetec can be used as the input data frame.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
wl.freq	A numeric vector of length 1 specifying the window length of the spectrogram for measurements on the frequency spectrum. Default is 512. Higher values would provide more accurate measurements.
length.out	A numeric vector of length 1 giving the number of measurements of dominant frequency desired (the length of the time series).
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz). Default is c(0, 22).

<code>threshold</code>	amplitude threshold (%) for dominant frequency detection. Default is 15. Note that amplitude threshold for time and frequency domains can be defined independently. See " <code>threshold.time</code> " and " <code>threshold.freq</code> " arguments.
<code>threshold.time</code>	amplitude threshold (%) for the time domain. Use for dominant frequency detection. If NULL (default) then the ' <code>threshold</code> ' value is used.
<code>threshold.freq</code>	amplitude threshold (%) for the frequency domain. Use for frequency range detection from the spectrum (see ' <code>frange.detec</code> '). If NULL (default) then the ' <code>threshold</code> ' value is used.
<code>img</code>	Logical argument. If FALSE, image files are not produced. Default is TRUE.
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
<code>path</code>	Character string containing the directory path where the sound files are located.
<code>img.suffix</code>	A character vector of length 1 with a suffix (label) to add at the end of the names of image files.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>clip.edges</code>	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed. If TRUE this edges will be excluded and signal contour will be calculated on the remaining values. Default is FALSE.
<code>leglab</code>	A character vector of length 1 or 2 containing the label(s) of the frequency contour legend in the output image.
<code>frange.detec</code>	Logical. Controls whether frequency range of signal is automatically detected using the <code>frange.detec</code> function. If so, the range is used as the bandpass filter (overwriting ' <code>bp</code> ' argument). Default is FALSE.
<code>fsmooth</code>	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window (in kHz) used for frequency range detection (when <code>frange.detec = TRUE</code>). This help to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.
<code>...</code>	Additional arguments to be passed to <code>trackfreqs</code> for customizing graphical output.

Details

This function extracts the dominant frequency values as a time series. The function uses the `approx` function to interpolate values between dominant frequency measures. If there are no frequencies above the amplitude threshold at the beginning or end of the signals then NAs will be generated. On the other hand, if there are no frequencies above the amplitude threshold in between signal segments in which amplitude was detected then the values of this adjacent segments will be interpolated to fill out the missing values (e.g. no NAs in between detected amplitude segments).

Value

A data frame with the dominant frequency values measured across the signals. If `img` is TRUE it also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the dominant frequencies (see `trackfreqs` description for more details).

writeWave(Phae.long1, "Phae.long1.wav")

# run function
dfts(X = selec.table, length.out = 30, flim = c(1, 12), bp = c(2, 9), wl = 300)

}
```

ffDTW

Acoustic dissimilarity using dynamic time warping on fundamental frequency contours

Description

ffDTW calculates acoustic dissimilarity of fundamental frequency contours using dynamic time warping. Internally it applies the [dtwDist](#) function from the dtw package.

Usage

```
ffDTW(X, wl = 512, length.out = 20, wn = "hanning", ovlp = 70,
bp = c(0, 22), threshold = 5, img = TRUE, parallel = 1, path = NULL,
img.suffix = "ffDTW", pb = TRUE, clip.edges = TRUE, window.type = "none",
open.end = FALSE, scale = FALSE, ...)
```

Arguments

X 'selec.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The output of [manualoc](#) or [autodetec](#) can be used as the input data frame.

<code>wl</code>	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
<code>length.out</code>	A numeric vector of length 1 giving the number of measurements of fundamental frequency desired (the length of the time series).
<code>wn</code>	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
<code>ovlp</code>	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
<code>bp</code>	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz). Default is <code>c(0, 22)</code> .
<code>threshold</code>	amplitude threshold (%) for fundamental frequency detection. Default is 5.
<code>img</code>	Logical argument. If FALSE, image files are not produced. Default is TRUE.
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>img.suffix</code>	A character vector of length 1 with a suffix (label) to add at the end of the names of image files. Default is NULL.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>clip.edges</code>	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed. If TRUE (default) this edges will be excluded and signal contour will be calculated on the remaining values. Note that DTW cannot be applied if missing values (e.i. when amplitude is not detected).
<code>window.type</code>	dtw windowing control parameter. Character: "none", "itakura", or a function (see dtw).
<code>open.end</code>	dtw control parameter. Performs open-ended alignments (see dtw).
<code>scale</code>	Logical. If TRUE dominant frequency values are z-transformed using the scale function, which "ignores" differences in absolute frequencies between the signals in order to focus the comparison in the frequency contour, regardless of the pitch of signals. Default is TRUE.
<code>...</code>	Additional arguments to be passed to trackfreqs for customizing graphical output.

Details

This function extracts the fundamental frequency values as a time series and then calculates the pairwise acoustic dissimilarity of the selections using dynamic time warping. The function uses the [approx](#) function to interpolate values between fundamental frequency measures. If 'img' is TRUE the function also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the fundamental frequencies. Note that if no amplitude is detected at the beginning or end of the signals then NAs will be generated. On the other hand, if amplitude

is not detected in between signal segments in which amplitude was detected then the values of this adjacent segments will be interpolated to fill out the missing values (e.g. no NAs in between detected amplitude segments).

Value

A matrix with the pairwise dissimilarity values. If `img` is `FALSE` it also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the fundamental frequencies.

ffDTW(selec.table[1:4,], length.out = 30, flim = c(1, 12), img = TRUE, bp = c(1, 9), wl = 300)
}
```

ffts

Extract the fundamental frequency values as a time series

Description

`ffts` extracts the fundamental frequency values as a time series of signals selected by [manualoc](#) or [autodetec](#).

Usage

```
ffts(X, wl = 512, length.out = 20, wn = "hanning", ovlp = 70, bp = c(0, 22),
     threshold = 15, img = TRUE, parallel = 1, path = NULL, img.suffix = "ffts", pb = TRUE,
     clip.edges = FALSE, leglab = "ffts", ff.method = "seewave", ...)
```

Arguments

X	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The output of manualoc or autodetec can be used as the input data frame.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
length.out	A numeric vector of length 1 giving the number of measurements of fundamental frequency desired (the length of the time series).
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz). Default is c(0, 22).
threshold	amplitude threshold (%) for fundamental frequency detection. Default is 15.
img	Logical argument. If FALSE, image files are not produced. Default is TRUE.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
img.suffix	A character vector of length 1 with a suffix (label) to add at the end of the names of image files.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
clip.edges	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed. If TRUE this edges will be excluded and signal contour will be calculated on the remaining values. Default is FALSE. #' @param leglab A character vector of length 1 or 2 containing the label(s) of the frequency contour legend in the output image.
leglab	A character vector of length 1 or 2 containing the label(s) of the frequency contour legend in the output image.
ff.method	Character. Selects the method used to calculate the fundamental frequency. Either 'tuneR' (using FF) or 'seewave' (using fund). Default is 'seewave'. 'tuneR' performs faster (and seems to be more accurate) than 'seewave'.
...	Additional arguments to be passed to trackfreqs . for customizing graphical output.

Details

This function extracts the fundamental frequency values as a time series. The function uses the [approx](#) function to interpolate values between fundamental frequency #' measures. If there are no frequencies above the amplitude threshold at the beginning or end of the signals then NAs will be generated. On the other hand, if there are no frequencies above the amplitude threshold in between signal segments in which amplitude was detected then the values of this adjacent segments will be interpolated to fill out the missing values (e.g. no NAs in between detected amplitude segments).

Value

A data frame with the fundamental frequency values measured across the signals. If `img` is TRUE it also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the fundamental frequencies (see [trackfreqs](#) description for more details).

writeWave(Phae.long2, "Phae.long2.wav") #save sound files

# run function
ffts(selec.table, length.out = 50, flim = c(1, 12), bp = c(2, 9), wl = 300)

# Fundamental frequency is not accurate for noisy signals, works better with pure tones
}
```

filtersels

Subset selection data frames based on manually filtered image files

Description

filtersels subsets selection data frames based on image files that have been manually filtered.

Usage

```
filtersels(X, path = NULL, lspec = FALSE, img.suffix = NULL, it = "jpeg",
  incl.wav = TRUE, missing = FALSE, index = FALSE)
```

Arguments

<code>X</code>	'selection.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections. The output of manualoc or autodetec can be used as the input data frame.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>lspec</code>	A logical argument indicating if the image files to be used for filtering were produced by the function lspec . All the image files that correspond to a sound file must be deleted in order to be filtered out.
<code>img.suffix</code>	A character vector of length 1 with the suffix (label) at the end of the names of the image files. Default is NULL (i.e. no suffix as in the images produced by speccreator). Ignored if <code>lspec = TRUE</code> .
<code>it</code>	A character vector of length 1 giving the image type ("tiff", "jpeg" or "pdf"). Default is "jpeg". Note that pdf files can only be generated by lspec2pdf .
<code>incl.wav</code>	Logical. To indicate if sound files extensions (".wav") are included (TRUE, default) or not in the image file names.
<code>missing</code>	Logical. Controls whether the output data frame (or row index if <code>index = TRUE</code>) contains the selections with images in the working directory (Default, <code>missing = FALSE</code>) or the ones with no image.
<code>index</code>	Logical. If TRUE and <code>missing = FALSE</code> the row index for the selections with images in the working directory is returned. If <code>missing = TRUE</code> then the row index of the ones with no image is returned instead. Default is FALSE.

Details

This function subsets selections (or sound files if `lspec` is TRUE) listed in a data frame based on the image files from spectrogram-creating functions (e.g. [speccreator](#)) in the working directory. Only the selections/sound files with and image in the working directory will remain. This is useful for excluding selections from undesired signals. Note that the image files should be in the working directory (or the directory provided in 'path').

Value

If all .wav files are ok, returns message "All files are ok!". Otherwise returns "These file(s) cannot be read" message with names of the corrupted .wav files.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>)

Examples

```
{
# First set temporary folder
setwd(tempdir())

# save wav file examples
data(list = c("Phae.long1", "Phae.long2", "Phae.long3", "selec.table"))
writeWave(Phae.long1,"Phae.long1.wav")
writeWave(Phae.long2,"Phae.long2.wav")
writeWave(Phae.long3,"Phae.long3.wav")

speccreator(selec.table, flim = c(0, 11), inner.mar = c(4,4.5,2,1), outer.mar = c(4,2,2,1),
picsize = 2, res = 300, cexlab = 2, mar = 0.05, wl = 300)

#go to the working directory and delete some images

#filter selection data frame
fmloc <- filtersels(X = selec.table)

#this data frame does not have the selections corresponding to the images that were deleted
fmloc

#now using lspect images
lspec(sxrow = 2, rows = 8, pal = reverse.heat.colors, wl = 300, ovlp = 10)

#go to the working directory and delete lspect images (the ones with several rows of spectrograms)

#filter selection data frame

}
```

fixwavs

Fix .wav files to allow importing them into R

Description

fixwavs fixes sound files in .wav format so they can be imported into R.

Usage

```
fixwavs(checksels = NULL, files = NULL, samp.rate = NULL, bit.rate = NULL,
path = NULL, ...)
```

Arguments

checksels	Data frame with results from checksels .
files	Character vector with the names of the wav files to fix. Default is NULL.
samp.rate	Numeric vector of length 1 with the sampling rate (in kHz) for output files. Default is NULL.

<code>bit.rate</code>	Numeric vector of length 1 with the dynamic interval (i.e. bit rate) for output files. Default is NULL. Currently not available.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>...</code>	Additional arguments to be passed to <code>sox</code> .

Details

This function aims to simplify the process of converting sound files that cannot be imported into R to a format that can actually be imported. Problematic files can be determined using `checksels`. The `checksels` output can be directly input using the argument `'checksels'`. Alternatively a vector of file names to be "fixed" can be provided (argument `'files'`). Internally the function calls `'sox'` through the `sox` function. `'sox'` must be installed to be able to run this function.

Value

A folder inside the working directory (or path provided) all `'converted_sound_files'`, containing sound files in a format that can be imported in R.

Author(s)

writeWave(Phae.long2,"Phae.long2.wav")
writeWave(Phae.long3,"Phae.long3.wav")
writeWave(Phae.long4,"Phae.long4.wav")

fixwavs(files = selec.table$sound.files)

#check this folder
getwd()

## End(Not run)
```

frange

*Detect frequency range iteratively***Description**

frange detect frequency range iteratively from signals in a selection table.

Usage

```
frange(X, wl = 512, it = "jpeg", line = TRUE, fsmooth = 0.1, threshold = 10,
wn = "hanning", flim = c(0, 22), bp = NULL, propwidth = FALSE, xl = 1, picsize = 1,
res = 100, fast.spec = FALSE, ovlp = 50, pal = reverse.gray.colors.2, parallel = 1,
widths = c(2, 1), main = NULL, img = TRUE, mar = 0.05, path = NULL, pb = TRUE)
```

Arguments

X	'selection.table' or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. The output of manualoc or autodetec can be used as the input data frame.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512. This is used for calculating the frequency spectrum (using meanspec) and producing the spectrogram (using spectro , if <code>img = TRUE</code>).
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
line	Logical argument to add red lines (or box if bottom.freq and top.freq columns are provided) at start and end times of selection. Default is TRUE.
fsmooth	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window in kHz. This help to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.
threshold	Amplitude threshold (%) for fundamental frequency and dominant frequency detection. Default is 10.
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options. This is used for calculating the frequency spectrum (using meanspec) and producing the spectrogram (using spectro , if <code>img = TRUE</code>).
flim	A numeric vector of length 2 for the frequency limit of the spectrogram (in kHz), as in spectro . Default is c(0, 22).
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz) or "frange" to indicate that values in 'bottom.freq' and 'top.freq' columns will be used as bandpass limits. Default is c(0, 22).
propwidth	Logical argument to scale the width of spectrogram proportionally to duration of the selected call. Default is FALSE.

<code>x1</code>	Numeric vector of length 1. A constant by which to scale spectrogram width. Default is 1.
<code>picsize</code>	Numeric argument of length 1. Controls relative size of spectrogram. Default is 1.
<code>res</code>	Numeric argument of length 1. Controls image resolution. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
<code>fast.spec</code>	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast.spec' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
<code>ovlp</code>	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 50. This is used for calculating the frequency spectrum (using meanspec) and producing the spectrogram (using spectro , if <code>img = TRUE</code>).
<code>pal</code>	Color palette function for spectrogram. Default is <code>reverse.gray.colors.2</code> . See spectro for more palettes. Palettes as gray.2 may work better when <code>fast.spec = TRUE</code> .
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>widths</code>	Numeric vector of length 2 to control the relative widths of the spectro (first element) and spectrum (second element).
<code>main</code>	Character vector of length 1 specifying the img title. Default is NULL.
<code>img</code>	Logical. Controls whether a plot is produced. Default is TRUE.
<code>mar</code>	Numeric vector of length 1. Specifies the margins adjacent to the selections to set spectrogram limits. Default is 0.05.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>pb</code>	Logical argument to control progress bar and messages. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .

Details

This functions aims to automatize the detection of frequency ranges. The frequency range is calculated as follows:

- `bottom.freq` = the start frequency of the first amplitude "hill"
- `top.freq` = the end frequency of the last amplitude "hill"

If `img = TRUE` a graph including a spectrogram and a frequency spectrum is produced for each selection (saved as an image file in the working directory). The graph would include gray areas in the frequency ranges exluded by the bandpass ('bp' argument), dotted lines highlighting the detected range.

Value

The original data frame with an additional 2 columns for low and high frequency values. A plot is produced in the working directory if `img = TRUE` (see details).

flim = c(0, 11))
}
```

frange.detec

Detect frequency range on wave objects

Description

`frange.detec` detects the frequency range of acoustic signals in wave objects.

Usage

```
frange.detec(wave, wl = 512, fsmooth = 0.1, threshold = 10, wn = "hanning",
flim = c(0, 22), bp = NULL, fast.spec = FALSE, ovlp = 50, pal = reverse.gray.colors.2,
widths = c(2, 1), main = NULL, plot = TRUE, all.detec = FALSE)
```

Arguments

wave A 'wave' object produced by [readWave](#) or similar functions.

wl A numeric vector of length 1 specifying the window length of the spectrogram, default is 512. This is used for calculating the frequency spectrum (using [meanspec](#)) and producing the spectrogram (using [spectro](#), if `plot = TRUE`).

fsmooth	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window in kHz. This help to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.
threshold	Amplitude threshold (%) for fundamental frequency and dominant frequency detection. Default is 10.
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options. This is used for calculating the frequency spectrum (using meanspec) and producing the spectrogram (using spectro , if <code>plot = TRUE</code>).
flim	A numeric vector of length 2 for the frequency limit of the spectrogram (in kHz), as in spectro . Default is <code>c(0, 22)</code> .
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz) or "frange" to indicate that values in 'bottom.freq' and 'top.freq' columns will be used as bandpass limits. Default is <code>c(0, 22)</code> .
fast.spec	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast.spec' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 50. This is used for calculating the frequency spectrum (using meanspec) and producing the spectrogram (using spectro , if <code>plot = TRUE</code>).
pal	Color palette function for spectrogram. Default is <code>reverse.gray.colors.2</code> . See spectro for more palettes. Palettes as gray.2 may work better when <code>fast.spec = TRUE</code> .
widths	Numeric vector of length 2 to control the relative widths of the spectro (first element) and spectrum (second element).
main	Character vector of length 1 specifying the plot title. Default is NULL.
plot	Logical. Controls whether an image file is produced for each selection (in the working directory). Default is TRUE.
all.detec	Logical. If TRUE returns the start and end of all detected amplitude "hills". Otherwise only the range is returned. Default is FALSE.

Details

This functions aims to automatize the detection of frequency ranges. The frequency range is calculated as follows:

- `bottom.freq` = the start frequency of the first amplitude "hill"
- `top.freq` = the end frequency of the last amplitude "hill"

If `plot = TRUE` a graph including a spectrogram and a frequency spectrum is produced in the graphic device. The graph would include gray areas in the frequency ranges excluded by the bandpass ('bp' argument), dotted lines highlighting the detected range.

Value

A data frame with 2 columns for low and high frequency values. A plot is produced (in the graphic device) if `plot = TRUE` (see details).

is.selection.table(st)

class(st)
}
```

lspec

*Create long spectrograms of whole sound files***Description**

lspec produces image files with spectrograms of whole sound files split into multiple rows.

Usage

```
lspec(X = NULL, flim = c(0,22), sxrow = 5, rows = 10, collev = seq(-40, 0, 1),
ovlp = 50, parallel = 1, wl = 512, gr = FALSE, pal = reverse.gray.colors.2,
cex = 1, it = "jpeg", flist = NULL, redo = TRUE, path = NULL, pb = TRUE,
fast.spec = FALSE)
```

Arguments

X	'selection.table' object or data frame with results from manualoc or any data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). If given, two red dotted lines are plotted at the start and end of a selection and the selections are labeled with the selection number (and selection comment, if available). Default is NULL.
flim	A numeric vector of length 2 indicating the highest and lowest frequency limits (kHz) of the spectrogram, as in spectro . Default is c(0,22).

<code>sxrow</code>	A numeric vector of length 1. Specifies seconds of spectrogram per row. Default is 5.
<code>rows</code>	A numeric vector of length 1. Specifies number of rows per image file. Default is 10.
<code>collev</code>	A numeric vector of length 3. Specifies levels to partition the amplitude range of the spectrogram (in dB). The more levels the higher the resolution of the spectrogram. Default is <code>seq(-40, 0, 1)</code> .
<code>ovlp</code>	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 50. High values of <code>ovlp</code> slow down the function but produce more accurate selection limits (when <code>X</code> is provided).
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>wl</code>	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
<code>gr</code>	Logical argument to add grid to spectrogram. Default is FALSE.
<code>pal</code>	Color palette function for spectrogram. Default is <code>reverse.gray.colors.2</code> . See spectro for more palettes.
<code>cex</code>	A numeric vector of length 1 giving the amount by which text (including sound file and page number) should be magnified. Default is 1.
<code>it</code>	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
<code>flist</code>	character vector or factor indicating the subset of files that will be analyzed. Ignored if <code>X</code> is provided.
<code>redo</code>	Logical argument. If TRUE all selections will be analyzed again when code is rerun. If FALSE only the selections that do not have a image file in the working directory will be analyzed. Default is FALSE.
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>fast.spec</code>	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.

Details

The function creates spectrograms for complete sound files, printing the name of the sound files and the "page" number (p1-p2...) at the upper right corner of the image files. If results from [manualoc](#) are supplied (or an equivalent data frame), the function delimits and labels the selections. This function aims to facilitate visual inspection of multiple files as well as visual classification of vocalization units and the analysis of animal vocal sequences.

Value

image files with spectrograms of whole sound files in the working directory. Multiple pages can be returned, depending on the length of each sound file.

lspec2pdf

lspec2pdf combines [lspec](#) images in .jpeg format to a single pdf file.

Description

lspec2pdf combines [lspec](#) images in .jpeg format to a single pdf file.

Usage

```
lspec2pdf(keep.img = TRUE, overwrite = FALSE, parallel = 1, path = NULL, pb = TRUE)
```

Arguments

keep.img	Logical argument. Indicates whether jpeg files should be kept (default) or remove. (including sound file and page number) should be magnified. Default is 1.
overwrite	Logical argument. If TRUE all jpeg pdf will be produced again when code is rerun. If FALSE only the ones missing will be produced. Default is FALSE.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.

Details

The function combines spectrograms for complete sound files from the [lspec](#) function into a single pdf (for each sound file).

`make.selection.table` *Create 'selection.table' class objects*

Description

`make.selection.table` converts data frames into an object of class `selection.table`.

Usage

```
make.selection.table(X, max.dur = 10, path = NULL,...)
```

Arguments

<code>X</code>	data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. Columns for 'top.freq', 'bottom.freq' and 'channel' are optional. Alternatively, a 'selection.table' class object can be input to double check selections. The output of manualoc or autodetec can be used as the input object for other warbleR functions.
<code>max.dur</code>	the maximum duration of expected for a selection (ie. end - start).
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>...</code>	Additional arguments to be passed to checksels for customizing checking routine.

Details

This function creates an object of class 'selection.table'. The function checks 1) if the selections listed in the data frame correspond to .wav files in the working directory, 2) if the sound files can be read and if so, 3) if the start and end time of the selections are found within the duration of the sound files. Note that the sound files should be in the working directory (or the directory provided in 'path'). This is useful for avoiding errors in downstream functions (e.g. [specan](#), [xcorr](#), [catalog](#), [dfDTW](#)). Note that corrupt files can be fixed using [fixwavs](#) ('sox' must be installed to be able to run this function). The 'selection.table' class can be input in subsequent functions.

Value

An object of class `selection.table` which includes the original data.frame as well as the result of the checks as an additional attribute. This are used by downstream `warbleR` functions to improve efficiency and avoid errors due to missing or mislabeled data, or selection out of the ranges of the original sound files.

writeWave(Phae.long1,"Phae.long1.wav")
writeWave(Phae.long2,"Phae.long2.wav")
writeWave(Phae.long3,"Phae.long3.wav")
writeWave(Phae.long4,"Phae.long4.wav")

st <- make.selection.table(X = selec.table)

class(st)
}
```

manualoc

*Interactive view of spectrograms***Description**

manualoc produces an interactive spectrographic view in which the start and end times of acoustic signals can be measured.

Usage

```
manualoc(wl = 512, flim = c(0,12), seltime = 1, tdisp = NULL, recomm =
  FALSE, wn = "hanning", title = TRUE, selcomm = FALSE, osci = FALSE, player =
  NULL, pal = reverse.gray.colors.2, path = NULL, flist = NULL, fast.spec = FALSE)
```

Arguments

wl	A numeric vector of length 1 specifying the spectrogram window length. Default is 512.
flim	A numeric vector of length 2 specifying the frequency limit (in kHz) of the spectrogram, as in the function spectro . Default is c(0,12).
seltime	A numeric vector of length 1 indicating the time interval in seconds at which the spectrograms are produced with higher resolution (ovlp = 70) and oscilograms (if osci = TRUE). Default is 1 second.
tdisp	A numeric vector of length 1 specifying the length in seconds of the total sound file to be displayed. Default is NULL which displays the full sound file.
recomm	Logical argument. If TRUE pops up a comment window at the end of each sound file. The comment needs to be quoted. Default is FALSE.

wn	A character vector of length 1 specifying the window function (by default "hanning"). See function ftwindow for more options.
title	Logical argument. If TRUE the name of the sound file will be printed as the main title of the spectrogram window. Default is TRUE
selcomm	Logical argument. If TRUE pops up a comment window after each selection. The comment is printed as a label on the selected unit. The comment must be quoted. Default is FALSE
osci	Logical argument. If TRUE adds a oscillogram whenever the spectrograms are produced with higher resolution (see seltime). Default is FALSE.
player	Path to or name of a program capable of playing a wave file by invocation from the command line. If under Windows and no player is given, windows player will be chosen as the default. "vlc" works in Linux if vlc player is installed. The external program must be closed before resuming analysis. Default is NULL.
pal	A color palette function to be used to assign colors in the plot, as in spectro . Default is <code>reverse.gray.colors.2</code> . See Details.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
flist	character vector or factor indicating the subset of files that will be analyzed. Ignored if X is provided.
fast.spec	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.

Details

Users can zoom-in a specific sound file segment by clicking at the start and end (left side and right side) of the segment. To select the start and end of a vocalization unit the users need to click at the end and then at the start (right side and left side) of the unit. In addition, 6 "buttons" are provided at the upper right side of the spectrogram that allow to display a full view of the spectrogram ("Full view"), go back to the previous view ("Previous view"), stop the analysis ("Stop"), go to the next sound file ("Next rec"), play the current view using external software ("Play", see "player" argument), or delete the last manual selection in the current sound file ("Del-sel"). When a unit has been selected, the function plots a red circle with the selection number in the middle point of the selection in the spectrogram. It also plots vertical dotted lines at the start and end of the selection. The circle and lines "disappear" when the selection is deleted ("Del-sel" button). Only the last selection can be deleted.

The function produces a .csv file (`manualoc_output.csv`) with information about the .wav file name, selection number, start and end time, selection comment (`selcomm`), and sound file comment (`rec-comm`). The file is saved in the working directory and is updated every time the user moves into the next sound file (Next rec "button") or stop the process (Stop "button"). When resuming the process (after "stop" and re-running the function in the same working directory), the function will

keep the previous selections and will only pick up .wav files that are not present in the .csv file (not previously analyzed). When users go to the next sound file (Next rec "button") without making any selection the file is still included in the .csv file, with NA's in the "end", "time" and "selec" field.

Windows length (wl) controls the temporal and frequency precision of the spectrogram. A high "wl" value increases the frequency resolution but reduces the temporal resolution, and vice versa. Any color palette that comes with the seewave package can be used: temp.colors, reverse.gray.colors.1, reverse.gray.colors.2, reverse.heat.colors, reverse.terrain.colors, reverse.topo.colors, reverse.cm.colors, heat.colors, terrain.colors, topo.colors, cm.colors. The function is slow when working on files of length > 5min. In most cases other sound analysis softwares for manually selecting acoustic signals (e.g. Raven, Syrinx) should be preferred.

Value

.csv file saved in the working directory with start and end time of selections.

`move.imgs`*Move/copy image files between directories*

Description

`move.imgs` Move/copy image files created by [warbleR](#) between directories (folders).

Usage

```
move.imgs(from = NULL, to = NULL, it = "all", cut = TRUE,
  overwrite = FALSE, create.folder = TRUE, folder.name = "image_files")
```

Arguments

<code>from</code>	Directory path where image files to be copied are found. If NULL (default) then the current working directory is used.
<code>to</code>	Directory path where image files will be copied to.
<code>it</code>	A character vector of length 1 giving the image type to be used. "all", "tiff", "jpeg" and "pdf" are admitted ("all" includes all the rest). Default is "all".
<code>cut</code>	Logical. Determines if files are removed from the original location after being copied (cut) or not (just copied). Default is TRUE.
<code>overwrite</code>	Logical. Determines if files that already exist in the destination directory should be overwritten. Default is FALSE.
<code>create.folder</code>	Logical. Determines if are moved to a new folder (which is named with the "folder.name" argument). Ignored if 'to' is provided. Default is TRUE.
<code>folder.name</code>	Character string with the name of the new folder where the files will be copied to. Ignored if 'to' is provided. Default is "image_files".

Details

This function aims to simplify the manipulation of the image files produce by many of the [warbleR](#) function. It copies/cuts files between directories.

mp32wav

*Convert .mp3 files to .wav***Description**

mp32wav converts several .mp3 files in working directory to .wav format

Usage

```
mp32wav(samp.rate = 44.1, parallel = 1, from = NULL, to = NULL,
normalize = NULL, pb = TRUE)
```

Arguments

samp.rate	Sampling rate at which the .wav files should be written. The maximum permitted is 44.1 kHz (default). Units should be kHz.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
from	Character string containing the directory path where the .mp3 files are located. If NULL (default) then the current working directory is used.

to	Character string containing the directory path where the .wav files will be saved. If NULL (default) then the current working directory is used.
normalize	Character string containing the units to be used for amplitude normalization. Check (normalize) for details. If NULL (default) no normalization is carried out.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.

Details

convert all .mp3 files in working directory to .wav format. Function used internally to read .mp3 files ([readMP3](#)) sometimes crashes.

Value

.wav files saved in the working directory with same name as original mp3 files.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>) and Grace Smith Vidaurre

Examples

```
## Not run:
# First set temporary folder
setwd(tempdir())

#Then download mp3 files from xeno-canto
querxc(qword = "Phaethornis aethopygus", download = TRUE)

# Convert all files to .wav format
mp32wav()

#check this folder!!
getwd()

## End(Not run)
```

ovlp_sels	<i>Find overlapping selections</i>
-----------	------------------------------------

Description

ovlp_sels finds which selections overlap in time within a given sound file.

Usage

```
ovlp_sels(X, index = FALSE, pb = TRUE, max.ovlp = 0, relabel = FALSE,
drop = FALSE, priority = NULL, priority.col = NULL)
```

Arguments

<code>X</code>	'selection.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "selec": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. The output of manualoc or autodetec can be used as the input data frame. Other data frames can be used as input, but must have at least the 4 columns mentioned above.
<code>index</code>	Logical. Indicates if only the index of the overlapping selections would be returned. Default is FALSE.
<code>pb</code>	Logical argument to control progress bar and messages. Default is TRUE.
<code>max.ovlp</code>	Numeric vector of length 1 specifying the maximum overlap allowed (in seconds) . Default is 0.
<code>relabel</code>	Logical. If TRUE then selections names (selec column) are reset. Default is FALSE.
<code>drop</code>	Logical. If TRUE, when 2 or more selections overlap the function will remove all but one of the overlapping selection. Default is FALSE.
<code>priority</code>	Character vector. Controls the priority criteria used for removing overlapped selections. It must list the levels of the column used to determine priority (argument <code>priority.col</code>) in the desired priority order. Default is NULL.
<code>priority.col</code>	Character vector of length with the name of the column use to determine the priority of overlapped selections. Default is NULL.

Details

This function detects selections within a selection table that overlap in time. Selections must be listed in a data frame similar to [selec.table](#).

Value

A data frame with the columns in `X` plus an additional column ('`ovlp_sels`') indicating which selections overlap. The ones with the same number overlap with each other. If `drop = TRUE` only the non-overlapping selections are return. If 2 or more selections overlap only the first is kept.

querxc

Access 'Xeno-Canto' recordings and metadata

Description

querxc downloads recordings and metadata from 'Xeno-Canto' (<http://www.xeno-canto.org/>).

Usage

```
querxc(qword, download = FALSE, X = NULL, file.name = c("Genus", "Specific_epithet"),
parallel = 1, path = NULL, pb = TRUE)
```

Arguments

qword	Character vector of length one indicating the genus, or genus and species, to query 'Xeno-Canto' database. For example, <i>Phaethornis</i> or <i>Phaethornis longirostris</i> . (http://www.xeno-canto.org/). More complex queries can be done by using search terms that follow the xeno-canto advance query syntax. This syntax uses tags to search within a particular aspect of the recordings (e.g. country, location, sound type). Tags are of the form tag:searchterm'. For instance, 'type:song' will search for all recordings in which the sound type description contains the word 'song'. Several tags can be included in the same query. The query "phaethornis cnt:belize" will only return results for birds in the genus <i>Phaethornis</i> that were recorded in Belize. See http://www.xeno-canto.org/help/search for a full description and see examples below for queries using terms with more than one word.
download	Logical argument. If FALSE only the recording file names and associated metadata are downloaded. If TRUE, recordings are also downloaded to the working directory as .mp3 files. Default is FALSE. Note that if the recording is already in the working directory (as when the downloading process has been interrupted) it will be skipped. Hence, resuming downloading processes will not start from scratch.
X	Data frame with a 'Recording_ID' column and any other column listed in the file.name argument. Only the recordings listed in the data frame will be download (download argument is automatically set to TRUE). This can be used to select the recordings to be downloaded based on their attributes.
file.name	Character vector indicating the tags (or column names) to be included in the sound file names (if download = TRUE). Several tags can be included. If NULL only the 'Xeno-Canto' recording identification number ("Recording_ID") is used. Default is c("Genus", "Specific_epithet"). Note that recording id is always used (whether or not is listed by users) to avoid duplicated names.
parallel	Numeric. Controls whether parallel computing is applied when downloading mp3 files. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Currently only applied when downloading files. Might not work improve performance on Windows OS.

path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.

Details

This function queries for avian vocalization recordings in the open-access online repository 'Xeno-Canto' (<http://www.xeno-canto.org/>). It can return recordings metadata or download the associated sound files. Complex queries can be done by using search terms that follow the xeno-canto advance query syntax (check "qword" argument description). Files are double-checked after downloading and "empty" files are re-downloaded. File downloading process can be interrupted and resume later as long as the working directory is the same. Maps of recording coordinates can be produced using [xcmaps](#).

Value

If X is not provided the function returns a data frame with the following recording information: recording ID, Genus, Specific epithet, Subspecies, English name, Recordist, Country, Locality, Latitude, Longitude, Vocalization type, Audio file, License, URL, Quality, Time, Date. Sound files in .mp3 format are downloaded into the working directory if download = TRUE or if X is provided; a column indicating the names of the downloaded files is included in the output data frame.

```
## Not run:
# Set temporary working directory
setwd(tempdir())

# search without downloading
df1 <- querxc(qword = 'Phaethornis anthophilus', download = FALSE)
View(df1)

# downloading files
querxc(qword = 'Phaethornis anthophilus', download = TRUE)

# check this folder
getwd()

## search using xeno-canto advance query ###
orth.pap <- querxc(qword = 'gen:orthonyx cnt:papua loc:tari', download = FALSE)
```

```
# download file using the output data frame as input
querxc(X = orth.pap)

# use quotes for queries with more than 1 word (e.g. Costa Rica),note that the
# single quotes are used for the whole 'qword' and double quotes for the 2-word term inside
#Phaeochroa genus in Costa Rica
phae.cr <- querxc(qword = 'gen:phaeochroa cnt:"costa rica"', download = FALSE)

# several terms can be searched for in the same field
# search for all female songs in sound type
femsong <- querxc(qword = 'type:song type:female', download = FALSE)

## End(Not run)
```

rm_sil	<i>Remove silence in wave files</i>
--------	-------------------------------------

Description

rm_sil

Usage

```
rm_sil(path = NULL, min.sil.dur = 2, img = TRUE, it = "jpeg", flim = c(0, 12),
flist = NULL, parallel = 1, pb = TRUE)
```

Arguments

path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
min.sil.dur	Numeric. Controls the minimum duration of silence segments that would be removed.
img	Logical argument. If FALSE, image files are not produced. Default is TRUE.
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
flim	A numeric vector of length 2 indicating the highest and lowest frequency limits (kHz) of the spectrogram as in spectro . Default is c(0,12). Ignored if 'img = FALSE'.
flist	character vector or factor indicating the subset of files that will be analyzed. If not provided then all wave files in the working directory (or path) will be processed.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
pb	Logical argument to control progress bar and messages. Default is TRUE.

Details

The function removes silence segments (i.e. segments with very low amplitude values) from wave files.

Value

Sound files for which silence segments have been removed are saved in the new folder "removed_silence_files". If 'img = TRUE' then spectrogram images highlighting the silence segments that were removed are also saved.

selec.table	<i>Data frame of selections (i.e. selection table).</i>
-------------	---

Description

A data frame containing the start, end, low and high frequency of *Phaethornis longirostris* (Long-billed Hermit) songs from the example sound files included in this package.

Usage

```
data(selec.table)
```

Format

A data frame with 11 rows and 6 variables:

sound.files recording names
channel channel in which signal is found
selec selection numbers within recording
start start times of selected signal
end end times of selected signal
bottom.freq lower limit of frequency range
top.freq upper limit of frequency range
sel.comment selection comments
rec.comment recording comments

Source

Marcelo Araya Salas, warbleR

seltailor	<i>Interactive view of spectrograms to tailor selections</i>
-----------	--

Description

seltailor produces an interactive spectrographic view (similar to [manualoc](#)) in which the start/end times and frequency range of acoustic signals listed in a data frame can be adjusted.

Usage

```
seltailor(X = NULL, wl = 512, flim = c(0,22), wn = "hanning", mar = 0.5,
osci = TRUE, pal = reverse.gray.colors.2, ovlp = 70, auto.next = FALSE, pause = 1,
comments = TRUE, path = NULL, frange = FALSE, fast.spec = FALSE, ext.window = TRUE,
width = 15, height = 5, index = NULL, collevels = NULL,
title = c("sound.files", "selec"),...)
```

Arguments

<code>x</code>	'selection.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "selec": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. The output of manualoc or autodetec can be used as the input data frame. Other data frames can be used as input, but must have at least the 4 columns mentioned above. Notice that, if an output file ("seltailor_output.csv") is found in the working directory it will be given priority over an input data frame.
<code>wl</code>	A numeric vector of length 1 specifying the spectrogram window length. Default is 512.
<code>flim</code>	A numeric vector of length 2 specifying the frequency limit (in kHz) of the spectrogram, as in the function spectro . Default is c(0,22).
<code>wn</code>	A character vector of length 1 specifying the window function (by default "hanning"). See function ftwindow for more options.
<code>mar</code>	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of the selections to define spectrogram limits. Default is 0.5.
<code>osci</code>	Logical argument. If TRUE adds a oscillogram whenever the spectrograms are produced with higher resolution (see <code>selttime</code>). Default is TRUE. The external program must be closed before resuming analysis. Default is NULL.
<code>pal</code>	A color palette function to be used to assign colors in the plot, as in spectro . Default is <code>reverse.gray.colors.2</code> . See Details.
<code>ovlp</code>	Numeric vector of length 1 specifying the percent overlap between two consecutive windows, as in spectro . Default is 70.
<code>auto.next</code>	Logical argument to control whether the functions moves automatically to the next selection. The time interval before moving to the next selection is controled by the 'pause' argument.
<code>pause</code>	Numeric vector of length 1. Controls the duration of the waiting period before moving to the next selection (in seconds). Default is 1.
<code>comments</code>	Logical argument specifying if 'sel.comment' (when in data frame) should be included in the title of the spectrograms. Default is TRUE.
<code>path</code>	Character string containing the directory path where the sound files are located.
<code>frange</code>	Logical argument specifying whether limits on frequency range should be recorded. If NULL (default) then only the time limits are recorded.
<code>fast.spec</code>	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
<code>ext.window</code>	Logical. If TRUE then an external graphic window is used. Default dimensions can be set using the 'width' and 'height' arguments. Default is TRUE.
<code>width</code>	Numeric of length 1 controlling the width of the external graphic window. Ignored if <code>ext.window = FALSE</code> . Default is 15.

height	Numeric of length 1 controlling the height of the external graphic window. Ignored if <code>ext.window = FALSE</code> . Default is 5.
index	Numeric vector indicating which selections (rows) of 'X' should be tailored. Default is NULL. Ignored when the process is resumed. This can be useful when combined with filtersels) output (see 'index' argument in filtersels).
collevels	Numeric. Set of levels used to partition the amplitude range (see spectro).
title	Character vector with the names of the columns to be included in the title for each selection.
...	Additional arguments to be passed to the internal spectrogram creating function for customizing graphical output. The function is a modified version of spectro , so it takes the same arguments.

Details

This function produces an interactive spectrographic view in which users can select new time/frequency coordinates the selections. 4 "buttons" are provided at the upper right side of the spectrogram that allow to stop the analysis ("stop"), go to the next sound file ("next"), return to the previous selection ("previous") or delete the current selection ("delete"). When a unit has been selected, the function plots dotted lines in the start and end of the selection in the spectrogram (or a box if `frange = TRUE`). Only the last selection is kept for each selection that is adjusted. The function produces a .csv file (`seltailor_output.csv`) with the same information than the input data frame, except for the new time coordinates, plus a new column (`X$tailored`) indicating if the selection has been tailored. The file is saved in the working directory and is updated every time the user moves into the next sound file (next sel "button") or stop the process (Stop "button"). It also return the same data frame as and object in the R environment. If no selection is made (by clicking on the 'next' button) the original time/frequency coordinates are kept. When resuming the process (after "stop" and re-running the function in the same working directory), the function will continue working on the selections that have not been analyzed. The function also displays a progress bar right on top of the spectrogram. The zoom can be adjusted by setting the `mar` argument.

Value

data frame similar to `X` with the and a .csv file saved in the working directory with start and end time of selections.

sig2noise

*Measure signal-to-noise ratio***Description**

sig2noise measures signal-to-noise ratio across multiple files.

Usage

```
sig2noise(X, mar, parallel = 1, path = NULL, pb = TRUE, type = 1, eq.dur = FALSE,
in.db = TRUE, before = FALSE, lim.db = TRUE, bp = NULL, wl = 10)
```

Arguments

X	'selection.table' object or data frame with results from manualoc or any data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end).
mar	numeric vector of length 1. Specifies the margins adjacent to the start and end points of selection over which to measure noise.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
type	Numeric. Determine the formula to be used to calculate the signal-to-noise ratio (S = signal , N = background noise): <ul style="list-style-type: none"> 1: ratio of S mean amplitude envelope to N mean amplitude envelope ($\text{mean}(\text{env}(S)) / \text{mean}(\text{env}(N))$)

	<ul style="list-style-type: none"> • 2: ratio of S amplitude envelope quadratic mean to N amplitude envelope quadratic mean ($\text{rms}(\text{env}(S))/\text{rms}(\text{env}(N))$) • 3: ratio of the difference between S amplitude envelope quadratic mean and N amplitude envelope quadratic mean to N amplitude envelope quadratic mean ($(\text{rms}(\text{env}(S)) - \text{rms}(\text{env}(N)))/\text{rms}(\text{env}(N))$)
eq.dur	Logical. Controls whether the noise segment that is measured has the same duration than the signal (if TRUE, default FALSE). If TRUE then mar argument is ignored.
in.dB	Logical. Controls whether the signal-to-noise ratio is returned in decibels ($20 \cdot \log_{10}(\text{SNR})$). Default is TRUE.
before	Logical. If TRUE noise is only measured right before the signal (instead of before and after). Default is FALSE.
lim.dB	Logical. If TRUE the lowest signal-to-noise would be limited to -40 dB (if in.dB = TRUE). This would remove NA's that can be produced when noise segments have a higher amplitude than the signal itself. Default is TRUE.
bp	Numeric vector of length 2 giving the lower and upper limits of a frequency bandpass filter (in kHz). Default is NULL.
wl	A numeric vector of length 1 specifying the window length of the spectrogram for applying bandpass. Default is 10. Ignored if bp = NULL. Note that lower values will increase time resolution, which is more important for signal-to-noise ratio calculations.

Details

Signal-to-noise ratio (SNR) is a measure of the level of a desired signal compared to background noise. The function divides the mean amplitude of the signal by the mean amplitude of the background noise adjacent to the signal. A general margin to apply before and after the acoustic signal must be specified. Setting margins for individual signals that have been previously clipped from larger files may take some optimization, as for calls within a larger file that are irregularly separated. When margins overlap with another acoustic signal nearby, the signal-to-noise ratio (SNR) will be inaccurate. Any SNR less than or equal to one suggests background noise is equal to or overpowering the acoustic signal. [snrspecs](#) can be used to troubleshoot different noise margins.

Value

Data frame similar to [autodetec](#) output, but also includes a new variable with the signal-to-noise values.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>) and Grace Smith Vidaurre

Source

# specifying the correct margin is important
# use snrspecs to troubleshoot margins for sound files
sig2noise(selec.table[grepl("Phae.long1", selec.table$sound.files), ], mar = 0.2)

# this smaller margin doesn't overlap neighboring signals
sig2noise(selec.table[grepl("Phae.long1", selec.table$sound.files), ], mar = 0.1)
}
```

sim.coor.sing	<i>Simulated coordinated singing events.</i>
---------------	--

Description

sim.coor.sing Selections of simulated interactive singing events. The simulated events use the mean and standard deviation of real lekking *Phaethornis longirostris* (Long-billed Hermit hummingbird) songs and intervals between songs (e.i gaps). Three events are simulated: overlapping signals (ovlp), alternating signals (altern) and non-synchronized signals (uncoor).

Usage

```
data(sim.coor.sing)
```

Format

sim.coor.sing Simulated coordinated singing events that overlap and do not overlap most of the time, for use with `coor.test`

snrspecs	<i>Spectrograms with background noise margins</i>
----------	---

Description

snrspecs creates spectrograms to visualize margins over which background noise will be measured by [sig2noise](#).

Usage

```
snrspecs(X, wl = 512, flim = c(0, 22), wn = "hanning", ovlp = 70,
inner.mar = c(5, 4, 4, 2), outer.mar = c(0, 0, 0, 0), picsize = 1,
res = 100, cexlab = 1, title = TRUE,
propwidth= FALSE, xl=1, osci = FALSE, gr = FALSE, sc = FALSE, mar = 0.2,
snrmar = 0.1, it = "jpeg", parallel = 1, path = NULL, pb = TRUE)
```

Arguments

X	'selection.table' object or data frame with results from manualoc or any data frame with columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end).
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
flim	A numeric vector of length 2 for the frequency limit in kHz of the spectrogram, as in spectro . Default is c(0, 22).
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
inner.mar	Numeric vector with 4 elements, default is c(5,4,4,2). Specifies number of lines in inner plot margins where axis labels fall, with form c(bottom, left, top, right). See par .
outer.mar	Numeric vector with 4 elements, default is c(0,0,0,0). Specifies number of lines in outer plot margins beyond axis labels, with form c(bottom, left, top, right). See par .
picsize	Numeric argument of length 1, controls relative size of spectrogram. Default is 1.
res	Numeric argument of length 1 that controls image resolution. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
cexlab	Numeric vector of length 1 specifying relative size of axis labels. See spectro .
title	Logical argument to add a title to individual spectrograms. Default is TRUE.
propwidth	Logical argument to scale the width of spectrogram proportionally to duration of the selected call. Default is FALSE.
xl	Numeric vector of length 1, a constant by which to scale spectrogram width if propwidth = TRUE. Default is 1.
osci	Logical argument to add an oscillogram underneath spectrogram, as in spectro . Default is FALSE.
gr	Logical argument to add grid to spectrogram. Default is FALSE.
sc	Logical argument to add amplitude scale to spectrogram, default is FALSE.
mar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of the selections to define spectrogram limits. Default is 0.2. If snrmar is larger than mar, then mar is set to be equal to snrmar.

snrmar	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of the selections where noise will be measured. Default is 0.1.
it	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.

Details

This function can be used to test different margins to facilitate accurate SNR measurements when using [sig2noise](#) down the line. Setting margins for individual calls that have been previously clipped from larger files may take some optimization, as for calls within a larger file that are irregularly separated. Setting inner.mar to c(4,4.5,2,1) and outer.mar to c(4,2,2,1) works well when picsize = 2 or 3. Title font size, inner.mar and outer.mar (from mar and oma in par) don't work well when osci or sc = TRUE, this may take some optimization by the user.

Value

Spectrograms per selection marked with margins where background noise will be measured.

sp.en.ts

Extract the spectral entropy across signals as a time series

Description

sp.en.ts spectral entropy across signals as a time series. of signals selected by [manualoc](#) or [autodetec](#).

Usage

```

sp.en.ts(X, wl = 512, length.out = 20, wn = "hanning", ovlp = 70, bp = NULL,
threshold = 15, img = TRUE, parallel = 1, path = NULL, img.suffix = "sp.en.ts",
pb = TRUE, clip.edges = FALSE, leglab = "sp.en.ts", sp.en.range = c(2, 10), ...)

```

Arguments

X	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The ouput of manualoc or autodetec can be used as the input data frame.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512. Note that this is particularly important for measuring spectral entropy. Low values (~100) generate a very detail contour of the variation in spectral entropy that is probably not useful for assesing signal similarity.
length.out	A character vector of length 1 giving the number of measurements of spectral entropy desired (the length of the time series).
wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.

bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz). Default is NULL.
threshold	amplitude threshold (%) for dominant frequency detection. Default is 15.
img	Logical argument. If FALSE, image files are not produced. Default is TRUE.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
path	Character string containing the directory path where the sound files are located.
img.suffix	A character vector of length 1 with a suffix (label) to add at the end of the names of image files.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1.
clip.edges	Logical argument to control whether edges (start or end of signal) in which amplitude values above the threshold were not detected will be removed. If TRUE this edges will be excluded and signal contour will be calculated on the remaining values. Default is FALSE.
leglab	A character vector of length 1 or 2 containing the label(s) of the frequency contour legend in the output image.
sp.en.range	Numeric vector of length 2. Range of frequency in which to display the entropy values on the spectrogram (when img = TRUE). Default is c(2, 10). Negative values can be used in order to stretch more the range.
...	Additional arguments to be passed to trackfreqs for customizing graphical output.

Details

This function spectral entropy across signals as a time series. The function uses the [approx](#) function to interpolate values between spectral entropy measures (calculated with [csh](#)). If there are no frequencies above the amplitude threshold at the beginning or end of the signals then NAs will be generated. On the other hand, if there are no frequencies above the amplitude threshold in between signal segments in which amplitude was detected then the values of this adjacent segments will be interpolated to fill out the missing values (e.g. no NAs in between detected amplitude segments). Missing values at the start or end can be removed with "clip.edges".

Value

A data frame with the dominant frequency values measured across the signals. If img is TRUE it also produces image files with the spectrograms of the signals listed in the input data frame showing the location of the dominant frequencies (see [trackfreqs](#) description for more details).

Examples

```
{
# set the temp directory
setwd(tempdir())

#load data
data(list = c("Phae.long1", "Phae.long2", "Phae.long3", "Phae.long4","selec.table"))
writeWave(Phae.long2, "Phae.long2.wav") #save sound files
writeWave(Phae.long1, "Phae.long1.wav")
writeWave(Phae.long3, "Phae.long3.wav") #save sound files
writeWave(Phae.long4, "Phae.long4.wav")

# without clip edges
sp.en.ts(X = selec.table, threshold = 10, bp = NULL, clip.edges = FALSE, length.out = 10,
  type = "b", sp.en.range = c(-25, 10))

# with clip edges and length.out 10
sp.en.ts(X = selec.table, threshold = 10, bp = c(2, 12), clip.edges = TRUE, length.out = 10)

}
```

specan

Measure acoustic parameters in batches of sound files

Description

specan measures acoustic parameters on acoustic signals for which the start and end times are provided.

Usage

```
specan(X, bp = c(0,22), wl = 512, wl.freq = NULL, threshold = 15,
  parallel = 1, fast = TRUE, path = NULL, pb = TRUE, ovlp = 50, ff.method = "seewave",
  wn = "hanning", fsmooth = 0.1)
```

Arguments

X 'selection.table' object or data frame with the following columns: 1) "sound.files": name of the .wav files, 2) "sel": number of the selections, 3) "start": start time of selections, 4) "end": end time of selections. The output of [manualoc](#) or [autodetec](#) can be used as the input data frame.

bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz) or "frange" to indicate that values in bottom.freq and top.freq columns will be used as bandpass limits. Default is c(0, 22). Lower limit of bandpass is not applied to fundamental frequencies.
wl	A numeric vector of length 1 specifying the spectrogram window length. Default is 512. See 'wl.freq' for setting windows length independently in the frequency domain.
wl.freq	A numeric vector of length 1 specifying the window length of the spectrogram for measurements on the frequency spectrum. Default is 512. Higher values would provide more accurate measurements. Note that this allows to increase measurement precision independently in the time and frequency domain. If NULL (default) then the 'wl' value is used.
threshold	amplitude threshold (%) for fundamental frequency and dominant frequency detection. Default is 15.
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
fast	Logical. If TRUE (default) then the peakf acoustic parameter (see below) is not computed, which substantially increases performance (~9 times faster).
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar and messages. Default is TRUE. Note that progress bar is only used when parallel = 1.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, used for fundamental frequency (using fund or FF) and dominant frequency (using dfreq). Default is 50.
ff.method	Character. Selects the method used to calculate the fundamental frequency. Either 'tuneR' (using FF) or 'seewave' (using fund). Default is 'seewave'. Use trackfreqs to decide which method works the best. 'tuneR' performs faster (and seems to be more accurate) than 'seewave'.
wn	Character vector of length 1 specifying window name. Default is 'hanning'. See function ftwindow for more options.
fsmooth	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window (in kHz) used for mean peak frequency detection. This helps to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.

Details

The output of [manualoc](#) or [autodetec](#) can be used directly without any additional modification. The function measures 29 acoustic parameters (if `fast = TRUE`) on each selection in the data frame. Most parameters are produced internally by [specprop](#), [fpeaks](#), [fund](#), and [dfreq](#) from the package `seewave` and [FF](#) from the package `tuneR`. NAs are produced for fundamental and dominant frequency measures when there are no amplitude values above the threshold.

Value

Data frame with 'sound.files' and 'selec' as in the input data frame, plus the following acoustic parameters:

- duration: length of signal (in s)
- meanfreq: mean frequency. Weighted average of frequency by amplitude (in kHz)
- sd: standard deviation of frequency weighted by amplitude
- freq.median: median frequency. The frequency at which the signal is divided in two frequency intervals of equal energy (in kHz)
- freq.Q25: first quartile frequency. The frequency at which the signal is divided in two frequency intervals of 25% and 75% energy respectively (in kHz)
- freq.Q75: third quartile frequency. The frequency at which the signal is divided in two frequency intervals of 75% and 25% energy respectively (in kHz)
- freq.IQR: interquartile frequency range. Frequency range between 'freq.Q25' and 'freq.Q75' (in kHz)
- time.median: median time. The time at which the signal is divided in two time intervals of equal energy (in s)
- time.Q25: first quartile time. The time at which the signal is divided in two time intervals of 25% and 75% energy respectively (in s). See [acoustat](#)
- time.Q75: third quartile time. The time at which the signal is divided in two time intervals of 75% and 25% energy respectively (in s). See [acoustat](#)
- time.IQR: interquartile time range. Time range between 'time.Q25' and 'time.Q75' (in s). See [acoustat](#)
- skew: skewness. Asymmetry of the spectrum (see note in [specprop](#) description)
- kurt: kurtosis. Peakedness of the spectrum (see note in [specprop](#) description)
- sp.ent: spectral entropy. Energy distribution of the frequency spectrum. Pure tone ~ 0; noisy ~ 1. See [sh](#)
- time.ent: time entropy. Energy distribution on the time envelope. Pure tone ~ 0; noisy ~ 1. See [th](#)
- entropy: spectral entropy. Product of time and spectral entropy `sp.ent * time.ent`. See [H](#)
- sfm: spectral flatness. Similar to `sp.ent` (Pure tone ~ 0; noisy ~ 1). See [sfm](#)
- meanfun: average of fundamental frequency measured across the acoustic signal
- minfun: minimum fundamental frequency measured across the acoustic signal
- maxfun: maximum fundamental frequency measured across the acoustic signal
- meandom: average of dominant frequency measured across the acoustic signal
- mindom: minimum of dominant frequency measured across the acoustic signal
- maxdom: maximum of dominant frequency measured across the acoustic signal
- dfrange: range of dominant frequency measured across the acoustic signal
- modindx: modulation index. Calculated as the cumulative absolute difference between adjacent measurements of dominant frequencies divided by the dominant frequency range. 1 means the signals is not modulated.

- startdom: dominant frequency measurement at the start of the signal
- enddom: dominant frequency measurement at the end of the signal
- dfslope: slope of the change in dominant through time ((enddom-startdom)/duration). Units are kHz/s.
- peakf: peak frequency. Frequency with highest energy (only generated if fast = FALSE)
- meanpeakf: Mean peak frequency. Frequency with highest energy from the mean spectrum (see [meanspec](#)). Typically more consistent than peakf.
- bottom.freq: low frequency. Low limit of frequency range (only generated if frange.detec = TRUE)
- top.freq: high frequency. High limit of frequency range (only generated if frange.detec = TRUE)

speccreator

Spectrograms of selected signals

Description

speccreator creates spectrograms of signals selected by [manualoc](#) or [autodetec](#).

Usage

```
speccreator(X, wl = 512, flim = c(0, 22), wn = "hanning", pal
= reverse.gray.colors.2, ovlp = 70, inner.mar = c(5, 4, 4, 2), outer.mar =
c(0, 0, 0, 0), picsize = 1, res = 100, cexlab = 1, title = TRUE,
propwidth = FALSE, xl = 1, osci = FALSE, gr = FALSE, sc = FALSE, line = TRUE,
mar = 0.05, it = "jpeg", parallel = 1, path = NULL, pb = TRUE, fast.spec = FALSE, ...)
```

Arguments

<code>x</code>	'selection.table' or data frame containing columns for sound file name (sound.files), selection number (selec), and start and end time of signals (start and end). Low and high frequency columns are optional. The output of manualoc or autodetec can be used as the input data frame.
<code>wl</code>	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
<code>flim</code>	A numeric vector of length 2 for the frequency limit (in kHz) of the spectrogram, as in spectro . Default is <code>c(0, 22)</code> .
<code>wn</code>	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
<code>pal</code>	A color palette function to be used to assign colors in the plot, as in spectro . Default is <code>reverse.gray.colors.2</code> .
<code>ovlp</code>	Numeric vector of length 1 specifying the percent overlap between two consecutive windows, as in spectro . Default is 70.
<code>inner.mar</code>	Numeric vector with 4 elements, default is <code>c(5,4,4,2)</code> . Specifies number of lines in inner plot margins where axis labels fall, with form <code>c(bottom, left, top, right)</code> . See par .
<code>outer.mar</code>	Numeric vector with 4 elements, default is <code>c(0,0,0,0)</code> . Specifies number of lines in outer plot margins beyond axis labels, with form <code>c(bottom, left, top, right)</code> . See par .
<code>picsize</code>	Numeric argument of length 1. Controls relative size of spectrogram. Default is 1. Ignored when <code>propwidth</code> is TRUE.
<code>res</code>	Numeric argument of length 1. Controls image resolution. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
<code>cexlab</code>	Numeric vector of length 1 specifying the relative size of axis labels. See spectro .
<code>title</code>	Logical argument to add a title to individual spectrograms. Default is TRUE.
<code>propwidth</code>	Logical argument to scale the width of spectrogram proportionally to duration of the selection. Default is FALSE.
<code>xl</code>	Numeric vector of length 1. A constant by which to scale spectrogram width if <code>propwidth</code> = TRUE. Default is 1.
<code>osci</code>	Logical argument to add an oscillogram underneath spectrogram, as in spectro . Default is FALSE.
<code>gr</code>	Logical argument to add grid to spectrogram. Default is FALSE.
<code>sc</code>	Logical argument to add amplitude scale to spectrogram, default is FALSE.
<code>line</code>	Logical argument to add red lines at start and end times of selection (or box if <code>bottom.freq</code> and <code>top.freq</code> columns are provided). Default is TRUE.
<code>mar</code>	Numeric vector of length 1. Specifies the margins adjacent to the start and end points of selections, dealineating spectrogram limits. Default is 0.05.
<code>it</code>	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".

<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>fast.spec</code>	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
<code>...</code>	Additional arguments to be passed to the internal spectrogram creating function for customizing graphical output. The function is a modified version of spectro , so it takes the same arguments.

Details

This function provides access to bath process of (a modified version of) the [spectro](#) function from the 'seewave' package. The function creates spectrograms for visualization of vocalizations. Setting `inner.mar` to `c(4,4.5,2,1)` and `outer.mar` to `c(4,2,2,1)` works well when `picsize = 2` or `3`. Title font size, `inner.mar` and `outer.mar` (from `mar` and `oma`) don't work well when `osci` or `sc = TRUE`, this may take some optimization by the user. Setting 'fast' argument to TRUE significantly increases speed, although some options become unavailable, as `collevels`, and `sc` (amplitude scale). This option is indicated for signals with high background noise levels.

Value

Image files containing spectrograms of the signals listed in the input data frame.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>) and Grace Smith Vidaurre

```

trackfreqs

Spectrograms with frequency measurements

Description

trackfreqs creates spectrograms to visualize dominant and fundametal frequency measurements (contours) of signals selected by [manualoc](#) or [autodetec](#).

Usage

```

trackfreqs(X, wl = 512, wl.freq = 512, flim = c(0, 22), wn = "hanning", pal =
  reverse.gray.colors.2, ovlp = 70, inner.mar = c(5, 4, 4, 2), outer.mar =
  c(0, 0, 0, 0), picsize = 1, res = 100, cexlab = 1, title = TRUE, propwidth = FALSE,
  xl = 1, osci = FALSE, gr = FALSE, sc = FALSE, bp = c(0, 22), cex = c(0.6, 1),
  threshold = 15, threshold.time = NULL, threshold.freq = NULL, contour = "both",
  col = c("skyblue", "red2"), pch = c(21, 24), mar = 0.05, lpos = "topright",
  it = "jpeg", parallel = 1, path = NULL, img.suffix = NULL, custom.contour = NULL,
  pb = TRUE, type = "p", leglab = c("Ffreq", "Dfreq"), col.alpha = 0.6, line = TRUE,
  fast.spec = FALSE, ff.method = "seewave", frange.detec = FALSE,
  fsmooth = 0.1, widths = c(2, 1), freq.continuity = NULL, clip.edges = 2, ...)

```

Arguments

X	'selection.table' object or data frame with results containing columns for sound file name (sound.files), selection number (selec), and start and end time of signal (start and end). The ouput of manualoc or autodetec can be used as the input data frame.
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
wl.freq	A numeric vector of length 1 specifying the window length of the spectrogram for measurements on the frequency spectrum. Default is 512. Higher values would provide more accurate measurements.
flim	A numeric vector of length 2 for the frequency limit of the spectrogram (in kHz), as in spectro . Default is c(0, 22).

wn	Character vector of length 1 specifying window name. Default is "hanning". See function ftwindow for more options.
pal	A color palette function to be used to assign colors in the plot, as in spectro . Default is <code>reverse.gray.colors.2</code> .
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 70.
inner.mar	Numeric vector with 4 elements, default is <code>c(5,4,4,2)</code> . Specifies number of lines in inner plot margins where axis labels fall, with form <code>c(bottom, left, top, right)</code> . See par .
outer.mar	Numeric vector with 4 elements, default is <code>c(0,0,0,0)</code> . Specifies number of lines in outer plot margins beyond axis labels, with form <code>c(bottom, left, top, right)</code> . See par .
picsize	Numeric argument of length 1. Controls relative size of spectrogram. Default is 1.
res	Numeric argument of length 1. Controls image resolution. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
cexlab	Numeric vector of length 1 specifying the relative size of axis labels. See spectro .
title	Logical argument to add a title to individual spectrograms. Default is TRUE.
propwidth	Logical argument to scale the width of spectrogram proportionally to duration of the selected call. Default is FALSE.
x1	Numeric vector of length 1. A constant by which to scale spectrogram width. Default is 1.
osci	Logical argument to add an oscillogram underneath spectrogram, as in spectro . Default is FALSE.
gr	Logical argument to add grid to spectrogram. Default is FALSE.
sc	Logical argument to add amplitude scale to spectrogram, default is FALSE.
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz) or "frange" to indicate that values in <code>bottom.freq</code> and <code>top.freq</code> columns will be used as bandpass limits. Default is <code>c(0, 22)</code> .
cex	Numeric vector of length 2, specifies relative size of points plotted for frequency measurements and legend font/points, respectively. See spectro .
threshold	amplitude threshold (%) for fundamental and dominant frequency detection as well as frequency range from the spectrum (see 'frange.detec'). Default is 15. WILL BE DEPRECATED. Use 'threshold.time' and 'threshold.time' instead.
threshold.time	amplitude threshold (%) for the time domain. Use for fundamental and dominant frequency detection. If NULL (default) then the 'threshold' value is used.
threshold.freq	amplitude threshold (%) for the frequency domain. Use for frequency range detection from the spectrum (see 'frange.detec'). If NULL (default) then the 'threshold' value is used.
contour	Character vector, one of "df", "ff" or "both", specifying whether the dominant or fundamental frequencies or both should be plotted. Default is "both".

<code>col</code>	Vector of length 1 or 2 specifying colors of points plotted to mark fundamental and dominant frequency measurements respectively (if both are plotted). Default is <code>c("skyblue", "red2")</code> .
<code>pch</code>	Numeric vector of length 1 or 2 specifying plotting characters for the frequency measurements. Default is <code>c(21, 24)</code> .
<code>mar</code>	Numeric vector of length 1. Specifies the margins adjacent to the selections to set spectrogram limits. Default is 0.05.
<code>lpos</code>	Character vector of length 1 or numeric vector of length 2, specifying position of legend. If the former, any keyword accepted by <code>xy.coords</code> can be used (see below). If the latter, the first value will be the x coordinate and the second value the y coordinate for the legend's position. Default is "topright".
<code>it</code>	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
<code>parallel</code>	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing).
<code>path</code>	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
<code>img.suffix</code>	A character vector of length 1 with a suffix (label) to add at the end of the names of image files. Default is NULL.
<code>custom.contour</code>	A data frame with frequency contours for exactly the same sound files and selection as in X. The frequency values are assumed to be equally spaced in between the start and end of the signal. The first 2 columns of the data frame should contain the 'sound.files' and 'selec' columns and should be identical to the corresponding columns in X (same order).
<code>pb</code>	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when <code>parallel = 1</code> .
<code>type</code>	A character vector of length 1 indicating the type of frequency contour plot to be drawn. Possible types are "p" for points, "l" for lines and "b" for both.
<code>leglab</code>	A character vector of length 1 or 2 containing the label(s) of the frequency contour legend in the output image.
<code>col.alpha</code>	A numeric vector of length 1 within [0,1] indicating how transparent the lines/points should be.
<code>line</code>	Logical argument to add red lines (or box if <code>bottom.freq</code> and <code>top.freq</code> columns are provided) at start and end times of selection. Default is TRUE.
<code>fast.spec</code>	Logical. If TRUE then image function is used internally to create spectrograms, which substantially increases performance (much faster), although some options become unavailable, as <code>collevels</code> , and <code>sc</code> (amplitude scale). This option is indicated for signals with high background noise levels. Palette colors gray.1 , gray.2 , gray.3 , topo.1 and rainbow.1 (which should be imported from the package <code>monitoR</code>) seem to work better with 'fast' spectrograms. Palette colors gray.1 , gray.2 , gray.3 offer decreasing darkness levels. THIS IS STILL BEING TESTED.
<code>ff.method</code>	Character. Selects the method used to calculate the fundamental frequency. Either 'tuneR' (using FF) or 'seewave' (using fund). Default is 'seewave'. 'tuneR' performs faster (and seems to be more accurate) than 'seewave'.

<code>frange.detec</code>	Logical. Controls whether frequency range of signal is automatically detected using the <code>frange.detec</code> function. If so, the range is used as the bandpass filter (overwriting <code>'bp'</code> argument). Default is <code>FALSE</code> .
<code>fsmooth</code>	A numeric vector of length 1 to smooth the frequency spectrum with a mean sliding window (in kHz) used for frequency range detection (when <code>frange.detec = TRUE</code>). This help to average amplitude "hills" to minimize the effect of amplitude modulation. Default is 0.1.
<code>widths</code>	Numeric vector of length 2 to control the relative widths of the spectro (first element) and spectrum (second element, (when <code>frange.detec = TRUE</code>)).
<code>freq.continuity</code>	Numeric vector of length 1 to control whether dominant frequency detections outliers(i.e that differ from the frequency of the detections right before and after) would be removed. Should be given in kHz. Default is <code>NULL</code> .
<code>clip.edges</code>	Integer vector of length 1 to control if how many 'frequency-wise discontinuous' detection would be remove at the start and end of signals (see <code>'freq.continuity'</code> argument). Default is 2. Ignored if <code>freq.continuity = NULL</code> .
<code>...</code>	Additional arguments to be passed to the internal spectrogram creating function for customizing graphical output. The function is a modified version of <code>spectro</code> , so it takes the same arguments.

Details

This function provides visualization of frequency measurements as the ones made by `specan`, `dfts`, `ffts`, `dfDTW` and `ffDTW`. Frequency measures can be made by the function or input by the user (see `'custom.contour'` argument). If `frange = TRUE` the function uses `frange.detec` to detect the frequency range. In this case the graphical output includes a frequency spectrum showing the detection threshold.

Value

Spectrograms of the signals listed in the input data frame showing the location of the dominant and fundamental frequencies.

Author(s)

Grace Smith Vidaurre and Marcelo Araya-Salas (<araya-salas@cornell.edu>)

warbleR

warbleR: A package to streamline bioacoustic analysis

Description

warbleR is a package designed to streamline analysis of animal acoustic signals in R. This package allows users to collect open-access avian vocalizations data or input their own data into a workflow that facilitates spectrographic visualization and measurement of acoustic parameters. warbleR makes fundamental sound analysis tools from the R package seewave, as well as new tools not yet offered in the R environment, readily available for batch process analysis. The functions facilitate searching and downloading avian vocalizations from 'Xeno-Canto' <http://www.xeno-canto.org/>, creating maps of 'Xeno-Canto' recordings, converting .mp3 files to .wav files, checking .wav files, automatically detecting acoustic signals, selecting them manually, printing spectrograms of whole recordings or individual signals, measuring signal to noise ratio, cross-correlation and performing acoustic measurements.

The warbleR package offers three overarching categories of functions:

- Obtaining avian vocalization data
- Sound file management
- Streamlined (bio)acoustic analysis in R

Details

License: GPL (≥ 2)

Obtaining avian vocalization data

`querxc`: Download recordings and metadata from 'Xeno-Canto'

Managing sound files

`make.selection.table`: Create 'selection.table' class objects

`mp32wav`: Convert several .mp3 files in working directory to .wav format

`checksels`: Check whether selections can be read by subsequent functions

`checkwavs`: Check whether .wav files can be read by subsequent functions and the minimum windows length ("wl" argument) that can be used

`fixwavs`: Fix .wav files to allow importing them into R

`wavdur`: Determine the duration of sound files

`cut_sels`: Cut selections from a selection table into individual sound files

`rm_sil`: Remove silence segments from wave files

`consolidate`: Consolidate sound files into a single folder

Exploring/analyzing signal structure

`autodetec`: Automatically detect start and end of acoustic signals

`manualoc`: Interactive spectrographic view to measure start and end of acoustic signals

`autodetec`: Automatic detection of acoustic signals based on amplitude

`seltailor`: Interactive view of spectrograms to tailor start and end of selections

`sig2noise`: Measure signal-to-noise ratio across multiple files

`trackfreqs`: Create spectrograms to visualize frequency measurements

`filtersels`: Filter selection data frames based on filtered image files

`frange`: Detect frequency range iteratively from signals in a selection table

`frange.detec`: Detect frequency range in a Wave object

`specan`: Measure acoustic parameters on selected acoustic signals

`xcorr`: Pairwise cross-correlation of multiple signals

`dfts`: Extract the dominant frequency values across the signal as a time series

`ffts`: Extract the fundamental frequency values across the signal as a time series

`sp.en.ts`: Extract the spectral entropy values across the signal as a time series

`dfDTW`: Calculate acoustic dissimilarity using dynamic time warping on dominant frequency contours

`ffDTW`: Calculate acoustic dissimilarity using dynamic time warping on fundamental frequency contours

`compare.methods`: Produce graphs to visually assess performance of acoustic distance measurements

`coord.test`: Assess statistical significance of singing coordination

`ovlp_sels`: Find selections that overlap in time within a given sound file

@section Graphical outputs:

`xcmaps`: Create maps to visualize the geographic spread of 'Xeno-Canto' recordings

`catalog`: Produce a vocalization catalog with spectrograms in and array with several rows and columns

`catalog2pdf`: Combine catalog images to single pdf files

`coord.graph`: Create graphs of coordinated singing

`color.spectro`: Highlight spectrogram regions

`xcorr.graph`: Pairwise cross-correlation of multiple signals

`lspec`: Produce spectrograms of whole recordings split into multiple rows

`lspec2pdf`: Combine lspec images to single pdf files

`speccreator`: Create spectrograms of manualoc selections

`snrspecs`: Create spectrograms to visualize margins over which noise will be measured by sig2noise

Author(s)

Marcelo Araya-Salas & Grace Smith Vidaurre

Maintainer: Marcelo Araya-Salas (<araya-salas@cornell.edu>)

wavdur

Measure the duration of sound files

Description

wavdur measures the duration of sound files in '.wav' format

Usage

```
wavdur(files = NULL, path = NULL)
```

Arguments

files	Character vector with the names of the sound files to be measured. The sound files should be in the working directory or in the directory provided in 'path'.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.

Details

This function returns the duration (in seconds) of sound files.

Value

A data frame with the duration (in seconds) of the sound files.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>)

Examples

```
{
# Set temporary working directory
setwd(tempdir())

data(list = c("Phae.long1", "Phae.long2", "Phae.long3"))
writeWave(Phae.long1,"Phae.long1.wav")
writeWave(Phae.long2,"Phae.long2.wav")
writeWave(Phae.long3,"Phae.long3.wav")

wavdur()
}
```

xcmaps

Maps of 'Xeno-Canto' recordings by species

Description

xcmaps creates maps to visualize the geographic spread of 'Xeno-Canto' recordings.

Usage

```
xcmaps(X, img = TRUE, it = "jpeg", res = 100, labels = F)
```

Arguments

<code>X</code>	Data frame output from <code>querxc</code> .
<code>img</code>	A logical argument specifying whether an image file of each species map should be returned, default is TRUE.
<code>it</code>	A character vector of length 1 giving the image type to be used. Currently only "tiff" and "jpeg" are admitted. Default is "jpeg".
<code>res</code>	Numeric argument of length 1. Controls image resolution. Default is 100 (faster) although 300 - 400 is recommended for publication/ presentation quality.
<code>labels</code>	A logical argument defining whether dots depicting recording locations are labeled. If TRUE then the <code>Recording_ID</code> is used as label.

Details

This function creates maps for visualizing the geographic spread of recordings from the open-access online repository 'Xeno-Canto' (<http://www.xeno-canto.org/>). The function takes the output of `querxc` as input. Maps can be displayed in the graphic device or saved as images in the working directory.

Value

A map of 'Xeno-Canto' recordings per species (image file), or a faceted plot of species map(s) in the active graphic device.

Author(s)

Marcelo Araya-Salas (<araya-salas@cornell.edu>) and Grace Smith Vidaurre

Examples

```
## Not run:
# search in xeno-canto
X <- querxc("Phaethornis anthophilus", download = FALSE)

#create image in R graphic device
xcmaps(X, img = FALSE)

#or save it as a file in the working directory
xcmaps(X)

## End(Not run)
```

xcorr

*Spectrogram cross-correlation***Description**

xcorr estimates the similarity of two spectrograms by means of cross-correlation

Usage

```
xcorr(X, wl =512, frange= NULL, ovlp=90, dens=0.9, bp= NULL, wn='hanning',
cor.method = "pearson", parallel = 1, path = NULL, pb = TRUE, na.rm = FALSE,
dfrange = FALSE, cor.mat = TRUE)
```

Arguments

X	'selection.table' object or data frame containing columns for sound files (sound.files), selection number (selec), and start and end time of signal (start and end).
wl	A numeric vector of length 1 specifying the window length of the spectrogram, default is 512.
frange	A numeric vector of length 2 setting the upper and lower frequency limits (in kHz) in which to compare the signals. Must be provided. The dfts function can be used to determine this parameter if dfrange = TRUE. This method is more adequate for pure tone signals. Default is NULL.
ovlp	Numeric vector of length 1 specifying % of overlap between two consecutive windows, as in spectro . Default is 90. High values of ovlp slow down the function but produce more accurate results.
dens	Numeric vector of length 1 specifying the approximate density of points in which to sample amplitude. See makeTemplate . Default is 0.9.
bp	A numeric vector of length 2 for the lower and upper limits of a frequency bandpass filter (in kHz) in which to detect dominant frequency. Only applied when frange is NULL. Default is NULL.
wn	A character vector of length 1 specifying the window name as in ftwindow .
cor.method	A character vector of length 1 specifying the correlation method as in cor .
parallel	Numeric. Controls whether parallel computing is applied. It specifies the number of cores to be used. Default is 1 (i.e. no parallel computing). Not available in Windows OS.
path	Character string containing the directory path where the sound files are located. If NULL (default) then the current working directory is used.
pb	Logical argument to control progress bar. Default is TRUE. Note that progress bar is only used when parallel = 1. Note that progress bar is not completely accurate as the number of pairwise comparisons decreases on each iteration decreases. The first iteration runs n-1 comparisons while the last one only 1 (n = nrow(X)).

<code>na.rm</code>	Logical. If TRUE all NAs produced when pairwise cross-correlations failed are removed from the results. This means that all selections with at least 1 cross-correlation that failed are excluded.
<code>dfrange</code>	Logical. If TRUE the <code>dfts</code> function can be used to determine the frequency range in which to compare signals.
<code>corr.mat</code>	Logical. If TRUE only the correlation matrix is returned. Default is TRUE.

Details

This function calculates the pairwise similarity of multiple signals by means of spectrogram cross-correlation. This method "slides" one spectrogram over the other calculating a correlation of the amplitude values at each step. The function runs pairwise cross-correlations on several signals and returns a list including the correlation statistic for each "sliding" step as well as the maximum (peak) correlation for each pairwise comparison. To accomplish this the margins of the signals are expanded by half the duration of the signal both before and after the provided time coordinates. The correlation matrix could have NA's if some of the pairwise correlation did not work (common when sound files have been modified by band-pass filters). This function is a modified version of the `corMatch` and `makeTemplate` from the awesome R package 'monitoR'.

Value

If `corr.mat` is TRUE the function returns a matrix with the maximum (peak) correlation for each pairwise comparison. Otherwise it will return a list that includes 1) a data frame with the correlation statistic for each "sliding" step, 2) a matrix with the maximum correlation for each pairwise comparison, and 3) the frequency range.

Examples

```
{
#First set temporary working directory
setwd(tempdir())

#load data
data(list = c("Phae.long1", "Phae.long2", "Phae.long3", "Phae.long4", "selec.table"))
writeWave(Phae.long1, "Phae.long1.wav") #save sound files
writeWave(Phae.long2, "Phae.long2.wav")
writeWave(Phae.long3, "Phae.long3.wav")
```

```

writeWave(Phae.long4, "Phae.long4.wav")

xcor <- xcorr(X = selec.table, wl = 300, frange = c(2, 9), ovlp = 90,
dens = 1, wn = 'hanning', cor.method = "pearson")

}

```

xcorr.graph

Pairwise plots of spectrogram cross-correlation scores

Description

xcorr.graph generates pairwise plots showing the spectrogram cross-correlation scores against the time sliding.

Usage

```
xcorr.graph(X, cex.cor = 1, cex.lab = 1, cex.axis.lab = 1, rel.cex = FALSE, labs = NULL)
```

Arguments

X	Output from xcorr function.
cex.cor	A numeric vector of length 1 giving the amount by which correlation scores (in the upper triangle of the multipanel plot) should be magnified. Default is 1.
cex.lab	A numeric vector of length 1 giving the amount by which signal selection labels (in diagonal of the multipanel plot) should be magnified. Default is 1.
cex.axis.lab	A numeric vector of length 1 giving the amount by which the axis labels should be magnified. Default is 1.
rel.cex	Logical. Controls whether the size of the correlation scores (in the upper triangle of the multipanel plot) should be relative to the correlation score.
labs	Alternative selection labels. If not provided the combined name of sound files and selection numbers are used as labels. Default is FALSE.

Details

This function generates pairwise plots of the spectrogram cross-correlation scores by sliding step. The function takes the output of [xcorr](#) (when cor.mat is FALSE in [xcorr](#)) as input. The colors of the lines in the lower triangle of the plot matrix represent the strenght of the similarity between the two signals. The x axis shows the time difference between the two signals for each sliding step (0 means perfectly centered signals). Note that large number of signals may not display well in the default graphic device. In such cases saving the plot as and image file is advised.
